Anthehora pungens W.D. Clayton. *Kew Bull.* 32(1): 2 (1977).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zambia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Zambia: Casawa sand dunes, 1050 m, 14 Apr 1957, *H. M. Richards* 9232 (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): stipes sharp-pointed.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 30–40 cm long. Ligule an eciliate membrane, 0.5–2 mm long. Leaf-blades tapering towards tip, 2–6 cm long, 2.5–6 mm wide. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 2–6 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 4–6 in the cluster. Companion sterile spikelets sessile, 4–6 in the cluster. Involucre composed of imperfect spikelets, connate into a cup below, oblong, 6–6.5 mm long, base pungently stipitate (4mm long), base pubescent.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, elliptic, 6–6.5 mm long, longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes united below, coriaceous, thicker on margins, 13 -veined, pubescent, acuminate, awned, with 6–15 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 0.5 length of spikelet.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1 length of spikelet, membranous, puberulous, acute. Fertile lemma lanceolate, 4–5 mm long, cartilaginous, much thinner on margins, without keel. Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Malawi, Mozambique, Zambia.

Anthephora schinzii Hack. ex Schinz. *Verh. Bot. Ver. Brand.* 139. (1888).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>; *vide* TROPICOS and Kew Synonymy Database: HT: *H. Schinz s.n.*, no date, Namibia (W; IT: US-865422 (fragm. ex W)).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Derivation (Clifford & Bostock 2007): in honor of Hans Schinz (1858–1941) Swiss traveller and botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms geniculately ascending, 12–35 cm long, 4–5 -noded. Culm-internodes distally pubescent. Leaf-sheaths pilose. Ligule an eciliate membrane, 1.5–2 mm long. Leaf-blades 6–10 cm long, 4–6 mm wide, glaucous. Leaf-blade surface scaberulous, rough abaxially, pubescent, hairy adaxially. Leaf-blade margins cartilaginous, crenate. Leaf-blade apex acute, callose.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, flexuous, 3–7 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, scaberulous, glabrous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 4–5 in the cluster. Companion sterile spikelets sessile, 4–5 in the cluster. Involucre composed of imperfect spikelets, elliptic, 4–5 mm long, base obtuse, base villous.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, lanceolate, 5–6 mm long, as long as fertile, deciduous with the fertile. Companion sterile spikelet glumes free, coriaceous, 7–13 -veined, scaberulous (above), pubescent to villous (below), entire or dentate, 2 -fid, setaceously acuminate, muticous or awned, with 0–5 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume subulate, 3–3.5 mm long, hyaline, 1 -veined. Upper glume margins ciliate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate or oblong, 4–4.5 mm long, 1 length of spikelet, membranous, 3–6 -veined, puberulous, ciliate on margins, bearing hairs 2–3 mm long, obtuse or acute. Fertile lemma lanceolate or ovate, 4–4.5 mm long, chartaceous, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma margins flat, covering most of palea. Lemma apex acute. Palea 1 length of lemma, chartaceous, 1-keeled.

Flower and Fruit. Anthers 3, 2.5 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Angola. Namibia, Botswana, Northern Cape.

Antheophora truncata Robyns. *Bull. Jard. Bot. Brux.* 9: 198 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from DRC. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Zaire, Kasenga: *Robyns 1915* (K iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. trunco*, shorten by cutting off. Truncate with respect to ligules.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Anthephorinae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 25–100 cm long, rooting from lower nodes. Leaf-sheaths hirsute, with tubercle-based hairs. Leaf-sheath auricles erect. Ligule an eciliate membrane, 3–4 mm long. Leaf-blades 5–15 cm long, 2–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 3–10 cm long. Primary panicle branches accrescent to a central axis, with sessile scars on axis. Panicle axis angular, scabrous, bearing deciduous spikelet clusters. Spikelets subtended by an involucre. Fertile spikelets sessile, 3–4 in the cluster. Companion sterile spikelets sessile, 3–4 in the cluster. Involucre composed of imperfect spikelets, connate into a disc below, oblong, 3.5–6 mm long, base obtuse.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, oblong, 3.5–6 mm long, as long as fertile or longer than fertile, deciduous with the fertile. Companion sterile spikelet glumes united below, coriaceous, thinner on margins, winged on margins (above), 7–9 -veined, pubescent, emarginate to acute, awned, with 1–25 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume subulate, 1 length of spikelet.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 1 length of spikelet, membranous, 3 -veined, puberulous, acute. Fertile lemma lanceolate, 3.5–4 mm long, cartilaginous, much thinner on margins, without keel, 3 -veined, 0–3 -veined. Lemma margins flat, covering most of palea. Lemma apex acute. Palea cartilaginous, 1-keeled.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa, South Tropical Africa. DRC. Tanzania. Zambia, Zimbabwe.

Anthosachne aprica (? Löve & Connor) C. Yen & J.L. Yang. Yen et al, *Xiao mai zu sheng wu xi tong xue* [Triticeae biosystematics, *Kengyilia*, *Douglasdeweya*, *Agropyron*, *Australopyrum*, *Anthosachne*] 232 (2006). China Agricultural Press: Beijing.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Elymus*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (as *Elymus*), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (as *Elymus*).

TYPE from New Zealand. **Basionym or Replaced Name:** *Elymus apricus* A. Löve & H.E. Connor, *New Zealand J. Bot.*, 20(2): 182 (1982). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: New Zealand: Central Otago, hillsides above Roxburgh town, *H.E. Connor s.n.* (CHR-370822).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* growing in the sunshine. Savanna or grassland species.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or elongated. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Basal innovations intravaginal. Culms erect, 50–100 cm long. Culm-nodes black. Leaf-sheaths 7–10 cm long, keeled, striately veined, glabrous on surface or pubescent. Leaf-sheath oral hairs lacking or ciliate. Leaf-sheath auricles absent or falcate, 0.3–0.5 mm long. Ligule a ciliolate membrane, 0.3–0.5 mm long. Collar ciliate. Leaf-blades 20–30 cm long, 2–4 mm wide, glaucous. Leaf-blade surface ribbed, glabrous or pilose. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 18–25 cm long, bearing 3–7 fertile spikelets on each. Rhachis flattened, scabrous on margins. Spikelet packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets spreading or deflexed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 6–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 30–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long, pubescent. Floret callus 0.75 mm long, pilose.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5–10 mm long, 1 length of upper glume, coriaceous, without keels, 3 -veined. Lower glume margins ciliate. Lower glume apex acuminate to setaceously acuminate. Upper glume lanceolate, 5–10 mm long, coriaceous, without keels, 3 -veined. Upper glume margins ciliate. Upper glume apex acuminate to setaceously acuminate.

Florets. Fertile lemma lanceolate, 10–14 mm long, coriaceous, keeled, keeled above. Lemma surface scaberulous, rough above. Lemma margins scaberulous. Lemma apex entire or dentate, 2 -fid, awned, 1 -awned. Principal lemma awn apical or from a sinus, straight or curved, 22–45 mm long overall. Palea 6–13 mm long. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1–2.5 mm long, membranous. Anthers 3, 4–9 mm long, yellow or purple. Stigmas 2. Caryopsis with adherent pericarp, 7–10 mm long. Embryo 0.2 length of caryopsis.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Anthosachne falcis (H.E. Connor) Barkworth & S.W.L. Jacobs. *Telopea* 13 (1–2): 49 (2011).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Elymus*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (as *Elymus*), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (as *Elymus*).

TYPE from New Zealand. **Basionym or Replaced Name:** *Elymus falcis* H.E. Connor, *New Zealand J. Bot.*, 32(2): 132 (1994). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: New Zealand: Mt. Edwards, Canterbury, 5 Jan 1938, *V.D. Zotov s.n.* (CHR-19687).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. falx*, sickle. Of sickles, that is, the leaf-blades are often sickle-shaped.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal and intravaginal. Culms decumbent or prostrate, 10–35 cm long. Culm-internodes glaucous, smooth. Leaf-sheaths 2–5 cm long, striately veined, glabrous on surface or pubescent, with reflexed hairs. Leaf-sheath auricles absent. Ligule an eciliate membrane, 0.3–0.5 mm long, erose. Collar glabrous or pubescent. Leaf-blades curved, terete, 5–15 cm long, 0.5–0.7 mm wide, glaucous. Leaf-blade surface puberulous, hairy abaxially or on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 2–10 cm long, bearing 1–4 fertile spikelets on each. Rhachis flattened, smooth on margins or scaberulous on margins. Spikelet

packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–2 mm long, pubescent. Floret callus 0.75 mm long, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 4–9 mm long, 1 length of upper glume, coriaceous, 1-keeled, 3 -veined. Lower glume apex acuminate to setaceously acuminate. Upper glume lanceolate, 4–9 mm long, coriaceous, 1-keeled, 3 -veined. Upper glume apex acuminate to setaceously acuminate.

Florets. Fertile lemma lanceolate, 8–12 mm long, coriaceous, pruinose, keeled. Lemma midvein scabrous. Lemma surface scabrous, rough above. Lemma apex awned, 1 -awned. Principal lemma awn curved, reflexed, 30–50 mm long overall. Palea 7–10 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.2–1.4 mm long, membranous. Anthers 3, 2.4–2.5 mm long, yellow. Stigmas 2. Caryopsis with adherent pericarp, 6–6.5 mm long. Embryo 0.15 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Anthosachne kingiana (Endl.) Govaerts. *J. Bot. S. Aus.* .

TYPE from Australia, Norfolk Island. **Basionym or Replaced Name:** *Triticum kingianum* Endl., *Prodr. Fl. Norfolk*. 21 (1833)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bauer s.n.*, Norfolk Islands: Phillip Island (W).

Recent Synonyms: *Elymus kingianus* (Endl.) A. Love, *Feddes Repert.* 95: 469 (1984).

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial. Culms geniculately ascending, weak, 60 cm long. Leaf-sheath auricles falcate. Ligule an eciliate membrane, 0.5–1 mm long, truncate. Leaf-blades 10–12 cm long, 6–9 mm wide, flaccid. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 20 cm long. Rhachis flattened. Spikelet packing broadside to rhachis, lax. Rhachis internodes linear. Rhachis internode tip flat. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 25–30 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 10 mm long, 1 length of upper glume, coriaceous, without keels, 3 -veined. Lower glume apex attenuate. Upper glume lanceolate, 10 mm long, coriaceous, without keels, 5–7 -veined. Upper glume apex attenuate.

Florets. Fertile lemma lanceolate, 10–15 mm long, coriaceous, 5 -veined, more than 3-veined. Lemma apex attenuate, awned, 1 -awned. Principal lemma awn 7–10 mm long overall. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Lord Howe-Norfolk Is.

Anthosachne longiseta (Hitchc.) Barkworth & S.W.L. Jacobs. *Telopea* 13 (1–2): 49 (2011).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Elymus*), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*) (as *Elymus*).

TYPE from Papua New Guinea. **Basionym or Replaced Name:** *Brachypodium longisetum* Hitchc., *Brittonia* 2(2): 107 (1936)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L.J. Brass 4446*, May 1933-Jul 1933, Papua New Guinea: New Guinea, Central Div. (NY; IT: K, L, US-1614436).

Recent Synonyms: *Elymus longisetus* (Hitchc.) J.F. Veldkamp, *Blumea*, 34(1): 74 (1989).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. longus*, long; *seta*, bristle. Glumes or lemmas long awned.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 50–80 cm long. Culm-internodes distally glabrous. Culm-nodes black, glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Leaf-sheath auricles absent or falcate. Ligule an eciliate membrane, 0.6–1 mm long. Leaf-blades flat or involute, 9–33 cm long, 1–5 mm wide. Leaf-blade surface glabrous to pilose.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, arcuate, bilateral, 7–20 cm long, bearing 4–10 fertile spikelets on each. Spikelet packing broadside to rhachis. Rhachis internodes linear. Spikelets solitary. Fertile spikelets sessile. Pedicels present, oblong, 1 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 4–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 20–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long, pubescent. Floret callus evident, 1 mm long, pilose, with elliptic scar.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5–15 mm long, 0.75–0.85 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 6–18 mm long, 0.8–1.1 length of adjacent fertile lemma, coriaceous, without keels, 6–7 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 11–16 mm long, coriaceous, without keel, 5–7 -veined, more than 3-veined. Lemma lateral veins convergent above. Lemma surface puberulous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 32–42 mm long overall. Palea 1 length of lemma. Palea keels scabrous. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5–2 mm long, retained within floret. Stigmas 2. Ovary pubescent on apex. Caryopsis with adherent pericarp, 7.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Papuaasia. New Guinea West Papua (Irian Jaya). New Guinea.

Anthosachne multiflora (Banks & Sol. ex Hook. f.) C. Yen & J.L. Yang. Yen et al, Xiao mai zu sheng wu xi tong xue [Triticeae biosystematics, *Kengyilia*, *Douglasdeweya*, *Agropyron*, *Australopyrum*, *Anthosachne*] 232 (2006). China Agricultural Press: Beijing.

Derivation (Clifford & Bostock 2007): *L. multus*, many; *flos*, flower. Spikelets with more florets than those of related species.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect or geniculately ascending, 35–70 cm long. Ligule an eciliate membrane, truncate. Collar glabrous. Leaf-blades 3–6 mm wide, mid-green. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 7–15 cm long, bearing 6–12 fertile spikelets on each. Rhachis flattened, scabrous on margins. Spikelet packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 6–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, curved, laterally compressed, 10–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pilose, with 1–2 mm long hairs. Floret callus bearded.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 8–10 mm long, 0.9 length of upper glume, coriaceous, without keels, 3–7 -veined. Lower glume apex setaceously acuminate. Upper glume lanceolate, 8–10 mm long, coriaceous, without keels, 3–7 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 10–13 mm long, coriaceous, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above. Lemma apex acute, muticous or mucronate or awned, 1 -awned. Principal lemma awn 1–5 mm long overall. Palea 1 length of lemma. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 3–5 mm long, purple. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand. Queensland, New South Wales, Victoria, Lord Howe-Norfolk Is. New Zealand North I, New Zealand South I. Southern. Central, South East, Inland. Coast, Tablelands.

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: **Type:** New South Wales, Inverell, *E.O. Thomas*; December 1912 (holotype: NSW).

Recent Synonyms: *Elymus plurinervis* (Vickery) Connor, *New Zealand Journal of Botany* 43(2): 500 (2005).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (237), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (100, Fig 14).

Classification. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial. Culms erect, 30–55 cm long. Leaf-sheath auricles falcate, 0.05–1.6 mm long. Ligule an eciliate membrane, 0.3–0.8 mm long. Leaf-blades 15–30 cm long, 1.8–4.1 mm wide.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 1, single, bilateral, 21–70 cm long, bearing few fertile spikelets, bearing 6–13 fertile spikelets on each. Rhachis flattened. Spikelet packing broadside to rhachis, distant. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–20 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 25–48 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate or obovate, 7.7–11 mm long, 0.9–1 length of upper glume, coriaceous, without keels, 5–6 -veined. Lower glume apex acute. Upper glume ovate or obovate, 8–12 mm long, 0.66–0.9 length of adjacent fertile lemma, coriaceous, without keels, 5–8 -veined. Upper glume apex acute.

Florets. Fertile lemma elliptic or ovate, 12–14.5 mm long, coriaceous, keeled, keeled above, 5–7 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn curved, 17–27 mm long overall. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 2.3–3 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, Victoria.

Anthosachne rectiseta (Nees) Barkworth & S.W.L. Jacobs. *Telopea* 13 (1–2): 50(2011).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from Australia. **Basionym or Replaced Name:** *Vulpia rectiseta* Nees, *Lehm. Pl. Preiss.* 2: 107 (1846). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Preiss 1819.

Recent Synonyms: *Elymus rectisetus* (Nees) A. Love & H.E. Connor, *New Zealand J. Bot.*, 20(2): 183 (1982).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (237).

Derivation (Clifford & Bostock 2007): *L. rectus*, upright; *seta*, bristle.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal and intravaginal. Culms geniculately ascending or decumbent, 100–150 cm long. Culm-internodes smooth or scaberulous, distally pubescent. Leaf-sheaths 5–10 cm long, hirsute, with simple hairs or reflexed hairs. Leaf-sheath auricles falcate, 0.5–1 mm long. Ligule an eciliate membrane, 0.1 mm long, truncate. Leaf-blades 18 cm long, 1–4 mm wide. Leaf-blade surface smooth or scaberulous, hirsute, hairy on both sides.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, drooping, bilateral, 10–20 cm long, bearing 5–10 fertile spikelets on each. Rhachis flattened, scabrous on surface. Spikelet packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 40–55 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–2.3 mm long, pilose. Floret callus 0.75 mm long, pilose.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 4–10 mm long, 1 length of upper glume, coriaceous, 1-keeled, 3–5 -veined. Lower glume surface pilose, hairy at apex. Lower glume apex setaceously acuminate. Upper glume lanceolate, 4–10 mm long, coriaceous, 1-keeled, 3–5 -veined. Upper glume surface pilose, hairy at apex. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 9–11 mm long, coriaceous, keeled, keeled above. Lemma apex awned, 1 -awned. Principal lemma awn straight, 30–50 mm long overall. Palea 9–11 mm long. Palea apex emarginate or truncate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1–1.25 mm long, membranous. Anthers 3, 1.8–2.3 mm long. Stigmas 2. Caryopsis with adherent pericarp, 6–6.5 mm long. Embryo 0.15 length of caryopsis.

$2n = 42$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand. Western Australia, South Australia, New South Wales, Victoria, Lord Howe-Norfolk Is. New Zealand North I, New Zealand South I.

Ereman.

Anthosachne sacandros (H.E. Connor) Barkworth & S.W.L. Jacobs. *Telopea* 13 (1–2): 50 (2011).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from New Zealand. **Basionym or Replaced Name:** *Elymus sacandros* H.E. Connor, *New Zealand J. Bot.*, 32(2) 138 (1994). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand: Isolation Creek, NW of Ben More, Marlborough, 800 ft, Dec 1975, A.P. Druce s.n. (HT: CHR-279320).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sakos*, shield; *aner*, male. The dense web of hairs on the upper leaf-surface immediately above the ligule resemble the male pubes.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal and intravaginal. Culms erect, 15–40 cm long, rooting from lower nodes. Leaf-sheaths 3–12 cm long, ribbed, scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking or pubescent. Leaf-sheath auricles absent or falcate, 0.5–1 mm long. Ligule an eciliate membrane, 0.2–0.3 mm long. Collar pilose. Leaf-blades filiform, involute, 10–80 cm long, 0.5–0.7 mm wide, glaucous. Leaf-blade surface ribbed, pubescent, hairy adaxially. Leaf-blade margins ciliate, hairy at base.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 5–20 cm long, bearing 4–8 fertile spikelets on each. Rhachis flattened. Spikelet packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 40–60 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long, pilose. Floret callus 1–1.5 mm long, bearded. Floret callus hairs 1.5–2.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 4.5–6.5 mm long, 0.5–0.66 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower glume apex setaceously acuminate. Upper glume lanceolate, 7–11 mm long, coriaceous, without keels, 5–7 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 10–11.5 mm long, coriaceous. Lemma midvein thickened. Lemma surface scaberulous, rough above. Lemma margins scaberulous. Lemma apex awned, 1 -awned. Principal lemma awn curved, 25–60 mm long overall. Palea 10–11.5 mm long. Palea apex dentate, 2 -fid, acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.5–2 mm long, membranous. Anthers 3, 3.8–5.5 mm long. Stigmas 2. Caryopsis with adherent pericarp, 5–6 mm long. Embryo 0.25 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Anthosachne scabra (R.Br.) Nevski. *Trudy Sredne-Aziatsk. Gosud. Univ., Ser. 8b, Bot.* 17: 65 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Australia. **Basionym or Replaced Name:** *Festuca scabra* Labill., non Vahl(1791), *Nov. Holl. Pl.* 1: 22. t. 26 (1804). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *Festuca scabra* Labill. ; Australia, Tasmania: Coll?.

Recent Synonyms: *Elymus scabrus* (R. Br.) A.Löve, *Feddes Repert.* 95: 468 (1984).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (as *Agropyron*), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (as *A. scaber*), J.C.Tothill,& J.B.Hacker. *The grasses of southern Queensland* (1983) (81 as *Agropyron*), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (137, Fig. 21 as var. *scabrus*).

Derivation (Clifford & Bostock 2007): *L.* rough or gritty to the touch. Plants with rough leaf-blades, spikelets or stems.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 25–120 cm long. Culm-internodes smooth or antrorsely

scabrous. Culm-nodes glabrous. Leaves mostly basal. Ligule an eciliate membrane. Leaf-blades flat or involute, 10–40 cm long, 2–4 mm wide, glaucous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 15–25 cm long, bearing few fertile spikelets, bearing 2–12 fertile spikelets on each. Rhachis flattened. Spikelet packing broadside to rhachis, distant. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–20 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 25–35 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume oblong, 8–10 mm long, 0.66–0.8 length of upper glume, coriaceous, without keels, 3–5 -veined. Lower glume lateral veins ribbed. Lower glume apex acute. Upper glume oblong, 12 mm long, 1 length of adjacent fertile lemma, coriaceous, without keels, 5–7 -veined. Upper glume lateral veins ribbed. Upper glume apex acute.

Florets. Fertile lemma elliptic, 12 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 30–40 mm long overall. Palea 0.9 length of lemma. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, elliptic, membranous. Anthers 3, 2.5 mm long. Stigmas 2. Ovary pubescent on apex. Caryopsis with adherent pericarp.

TYPE from New Zealand. **Basionym or Replaced Name:** *Triticum solandrii* Steud., *Syn. Pl. Gram.* 347 (1854) ; *Triticum squarrosum* Banks & Soland. ex Hook.f., non Roth(1802), *Hook. Lond. Journ. Bot.* 3: 417 (1844). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: : Based on *T. squarrosum* Hook.f. ; New Zealand, Totaranui: Banks & Solander (BM lecto).

Recent Synonyms: *Elymus solandri* (Steud.) H.E. Connor, *New Zealand J. Bot.*, 32(2): 140 (1994).

Illustrations: None found.

Images: R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);

Derivation (Clifford & Bostock 2007): in honor of Daniel Carl Solander (1736–1782) Swedish-born English botanist.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Stolons present. Basal innovations extravaginal and intravaginal. Culms geniculately ascending or decumbent or prostrate, 40–100 cm long, rooting from lower nodes. Leaf-sheaths 3–5 cm long, keeled, puberulous. Leaf-sheath oral hairs pubescent. Leaf-sheath auricles falcate, 1–1.5 mm long. Ligule an eciliate membrane, 0.2–0.5 mm long, truncate. Collar pubescent. Leaf-blades flat or conduplicate or involute, 15–21 cm long, 2–4 mm wide, glaucous. Leaf-blade surface ribbed, puberulous, hairy adaxially. Leaf-blade margins smooth or scaberulous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 8–20 cm long, bearing 3–15 fertile spikelets on each. Rhachis flattened. Spikelet packing broadside to rhachis. Rhachis internodes linear. Rhachis internode tip flat. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic to oblong, laterally compressed, 25–80 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–3 mm long, pubescent. Floret callus 0.75 mm long, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 3–11 mm long, 0.66 length of upper glume, coriaceous, 1-keeled, 3 -veined. Lower glume surface asperulous, rough above. Lower glume apex acuminate to setaceously acuminate. Upper glume lanceolate, 5–12 mm long,

coriaceous, 1-keeled, 3–5 -veined. Upper glume surface asperulous, rough above. Upper glume apex acuminate to setaceously acuminate.

Florets. Fertile lemma lanceolate, 10–13 mm long, coriaceous. Lemma midvein thickened. Lemma margins scaberulous. Lemma apex awned, 1 -awned. Principal lemma awn curved, reflexed, 35–75 mm long overall. Palea 9.5–12 mm long. Palea apex dentate, 2 -fid, acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 1.25–1.5 mm long, membranous. Anthers 3, 3–5 mm long. Stigmas 2. Caryopsis with adherent pericarp, 5–6.5 mm long. Embryo 0.25 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I.

Anthoxanthum aethiopicum I. Hedberg. *Bot. Notiser* 129(1): 90 (1976).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ethiopia, Galama Mts: *Hedberg 4239* (UPS holo).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (41, Fig. 19).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. In classical usage Aethiopia was south of the Sudan and widely used in that sense.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated, wiry. Butt sheaths herbaceous. Culms erect or geniculately ascending or rambling, slender, 20–50 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades 9–17 cm long, 2–4 mm wide, light green, aromatic. Leaf-blade surface glabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or lanceolate, 3.5–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–8.4 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.5–8 mm long, 0.75–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 7–8.4 mm long, 2.5–2.8 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 3.3–4.3 mm long, chartaceous, without keels, 5 -veined, emarginate, awned. Awn of lower sterile floret 2.6–4.4 mm long. Lemma of upper sterile floret oblong, 2.3–4.4 mm long, chartaceous, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 6.7–8.5 mm long. Fertile lemma oblong, 2.5(–3.6) mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex emarginate. Palea oblong, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea).

Anthoxanthum altissimum (Steud.) Veldkamp. *Blumea* 30(2): 347. 1985.

Recent Synonyms: *Hierochloe utriculata* (Ruiz & Pav.) Kunth, *Rev. Gram.* 1 193. t. 8. (1830).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. altus*, tall; -issima, most. Very tall compared with other members of the genus.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Chile Central, Chile South. Biobio, La Araucania. Los Lagos, Aisen.

Anthoxanthum amarum Brot. Phyt. Lusit. 11. t. 4. f. 1. (1800).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Portugal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Portugal, Beira: Coll?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. unpleasant*. Foliage bitter to the taste.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Butt sheaths thickened and forming a bulb. Culms 60–90 cm long. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane. Leaf-blades lanceolate, 8–20 cm long, 6–15 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 3–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10–13 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 5–6 mm long, 0.5 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume elliptic, 10–13 mm long, 4 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acuminate.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5–6 mm long, 1.5–2 length of fertile lemma, scarious, without keels, pubescent, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 4–5 mm long. Lemma of upper sterile floret oblong, 5–6 mm long, 1 length of lower sterile floret, scarious, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, geniculate, 7–8 mm long. Fertile lemma orbicular, 2.5–3 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 5 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, ellipsoid. Hilum punctiform.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Southwestern Europe.

Country /Province /State. : Portugal, Spain. **Caucasus.** Transcaucasus.

Anthoxanthum arcticum (Steud.)Veldkamp. *Blumea* 30(2): 349 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe pauciflora*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Hierochloe pauciflora*).

TYPE from Canada. **Basionym or Replaced Name:** *Hierochloe pauciflora* R. Br., *Parry, Ist Voy. Suppl.* 193. (1824). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Parry s.n.*, 1820, Canada: Melville (BM; US (photo)).

ST: *Mr. Evens*, 1820, Melville Island (BM; US (photo)).

LT: *no. 67, Mr. Beverley*, 1820, Melville Island (BM; US (photo)). LT designated by A. J. W. [or M.?] (1935).

IST: *Ross Voy.*, 24 Jul 1820, Melville Island, Winter Harbour (BM; US (fragm. ex BM)).

Recent Synonyms: *Hierochloe pauciflora* R. Br., Parry, *Ist Voy. Suppl.* 193. (1824).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (763).

Derivation (Clifford & Bostock 2007): Gk *arktos*, north; *-ica*, belonging to. Occurring in and often extending beyond the Arctic.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 15–30 cm long. Culm-internodes smooth or scaberulous. Leaves mostly basal, much reduced on the culm. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades 10–20 cm long, 1–2 mm wide, aromatic. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1.5–3 cm long, bearing few spikelets. Primary panicle branches appressed, bearing 1–2 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, shiny. Lower glume ovate, 2.5 mm long, 0.75 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 3.5–4.5 mm long, 0.9 length of adjacent fertile lemma, hyaline, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 1 length of fertile lemma, membranous, 1-keeled, 5 -veined, scabrous, entire, acute, muticous or mucronate. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, membranous, scabrous, entire, acute, muticous or mucronate. Fertile lemma ovate, 4–5 mm long, cartilaginous, without keel, more than 3-veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 3 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male). Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** Europe, Temperate Asia, North America.

Region. Northern Europe, Eastern Europe.

Country /Province /State. North European Russia. Siberia, Russian Far East, **Middle Asia, Mongolia.** Krasnoyarsk. Sakhalin. **Subarctic America, Western Canada, Eastern Canada.** Alaska, Yukon, Northwest Territories, Nunavut. Manitoba. Ontario, Quebec.

Anthoxanthum aristatum Boiss. *Voy. Bot. Espagne* 2: 638. 1839–1845.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (268 as *A. puelii*), T. Cope & A. Gray, *Grasses of the British Isles* (84), G.Hegi, *Flora von Mitteleuropa* 1 (1909), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (761), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (466, Fig. 91), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:15(1980)).

Derivation (Clifford & Bostock 2007): L. *arista*, bristle; *-ata*, possessing. The apices of lemmas, paleas or glumes drawn out into a distinct awn.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Butt sheaths herbaceous, withering. Culms erect or geniculately ascending, 10–40 cm long, 4–5 -noded. Lateral branches sparse. Leaves mostly basal. Ligule an eciliate membrane, 1.5–3 mm long. Leaf-blades 0.8–6 cm long, 1–5 mm wide, aromatic. Leaf-blade surface glabrous or pubescent, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong or ovate, continuous or interrupted, 1–4 cm long, 0.3–1.2 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.1–0.3 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 5–7.5(–8) mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 3.6–5.2 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface glabrous. Lower glume apex acuminate, mucicous or mucronate. Upper glume elliptic, 5–7.5(–8) mm long, 2.5–4 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume surface glabrous. Upper glume apex acuminate, mucicous or mucronate.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 2.8–3.9 mm long, 1.5–2 length of fertile lemma, membranous, 1-keeled, 4–5 -veined, pilose, erose, truncate, awned. Awn of lower sterile floret dorsal, arising 0.6 way up back of lemma, 4–5 mm long. Lemma of upper sterile floret oblong, 3–4 mm long, 1 length of lower sterile floret, membranous, pilose, erose, truncate, awned. Awn of upper sterile floret dorsal, arising 0.1 way up back of lemma, geniculate, 7–10 mm long. Fertile lemma orbicular, (1.4–)1.6–2.1 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2.8–4.1 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, ellipsoid. Embryo 0.33 length of caryopsis. Hilum punctiform.

$2n = 3$ (3 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Australasia (*), North America.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Country /Province /State. : Denmark, Great Britain. Estonia, Latvia, Lithuania. **Northern Africa, Macaronesia.** Azores, Canary Is. **Western Asia.** East Aegean Is. **Australia** (*), **New Zealand** (*). Victoria (*). Anthoxanthum borii Jain & Pal. *J. Bombay Nat. Hist. Soc.* 72(1): 92. 1975.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Pulney hills, Shenthadikanal: Bourne 1954 (CAL holo).

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (781, Pl. 781).

Derivation (Clifford & Bostock 2007): in honor of Norman Loftus Bor (1893–1972) Irish-born Indian forest botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 30–120 cm long. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths smooth, glabrous on surface or pilose, with tubercle-based hairs. Ligule an eciliate membrane, erose, acute. Leaf-blade base broadly rounded. Leaf-blades 5–35 cm long, 4–12 mm wide, aromatic. Leaf-blade surface glabrous or pilose, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate or oblong, 5–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate or ovate, 4.5–5 mm long, 0.66–0.75 length of upper glume, chartaceous, yellow, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or ovate, 6–8 mm long, 2.5–3 length of adjacent fertile lemma, chartaceous, yellow, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5–6 mm long, chartaceous, without keels, 5 -veined, pubescent, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 3–4 mm long. Palea of lower sterile floret 4–5 mm long. Lemma of upper sterile floret oblong, 5–6 mm long, chartaceous, pubescent, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.33 way up back of lemma, straight, 10–12 mm long. Fertile lemma oblong or orbicular, 2–3 mm long, 1.5–2 mm wide, cartilaginous, without keel, 3–7 -veined, 0–3 -veined or more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea lanceolate, 1.5–2 mm long, 2 -veined.

Flower and Fruit. Lodicules absent. Anthers 2 or 3, 2–4 mm long. Stigmas 2, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Recent Synonyms: *Hierochloe davidsei* R. W. Pohl, *Iowa State J. Res.*, 47(1): 71 (1972).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Gerrit Davidse (1942-) Netherlands-born United States botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated. Culms erect, 30–60 cm long, 2–3 mm diam. Culm-internodes thin-walled, distally glabrous. Lateral branches lacking. Leaves 5–7 per branch. Leaf-sheaths ribbed, glabrous on surface or pilose, with reflexed hairs. Ligule an eciliate membrane, 1.5–5 mm long, pubescent on abaxial surface, truncate. Leaf-blades 6–15 cm long, 5–8 mm wide, aromatic. Leaf-blade surface pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle 10–15 cm long, glabrous. Panicle spiciform, linear, continuous or interrupted, 3–11 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–3 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 5.5–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 4–4.5 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 5.5–6.5 mm long, 1.8–2.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret lanceolate or oblong, 5 mm long, membranous, without keels, 5 -veined, ciliate on margins, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, arising 0.65–0.85 way up back of lemma, 1 mm long. Lemma of upper sterile floret oblong, 5 mm long, membranous, ciliate on margins, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal,

arising 0.5 way up back of lemma, geniculate, 4–5.5 mm long. Fertile lemma oblong, 3 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex emarginate, mucous or mucronate. Palea oblong, 3 mm long, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 1.5 mm long, yellow. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica.

Anthoxanthum dregeanum (Trin.) Stapf. *Flora Capensis* 7: 466–467. 1899.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Hierochloe dregeana* Nees ex Trin., *Phalar.* 37 (1839). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *J.F. Drège s.n.*, South Africa (L, MO).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (92, Fig. 63).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Johann Franz Drhge (1794–1881) German horticulturalist and plant collector in South Africa.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect, 20–60 cm long. Ligule an eciliate membrane. Leaf-blades flat or conduplicate, 12–25 cm long, 4–9 mm wide, stiff, aromatic. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, continuous or interrupted, 4–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 4.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume oblong, 6–7 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, male or barren, with palea or without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 6 mm long, 2 length of fertile lemma, chartaceous, without keels, 5 -veined, pubescent, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 3 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, geniculate, 9–10 mm long. Fertile lemma orbicular, 3 mm long, cartilaginous, dark brown, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 4.5 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Western Cape.

Anthoxanthum ecklonii (Nees ex Trin.) Stapf. *Fl. Cap.* 7:466. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Hierochloe ecklonii* (Nees ex Trin.) Nees, *Fl. Afr. Austr.* 1: 7 (1841). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Africa, Cape: Coll?.

Recent Synonyms: *Anthoxanthum brevifolium* Stapf, *Kew Bull.* 1910, 59. (1910).

Illustrations (Books): G.V.Pope et al., *Flora Zambesiaca* 10 (1(1971):73, t. 21), L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (94, Fig. 64), G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990) (44, Fig. 18).

Derivation (Clifford & Bostock 2007): in honor of Christian Frederick Ecklon (1795–1868) German-born South African apothecary and plant collector.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely or moderately. Rhizomes elongated. Culms 35–80 cm long, swollen at the base, forming an ovoid corm. Ligule an eciliate membrane. Leaf-blades 7–25 cm long, 4–9 mm wide, aromatic.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or oblong, 4–13 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 4.5–5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 6–8 mm long, 1.7–2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 2 or more, dissimilar, male or barren, with palea or without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5 mm long, 1.3 length of fertile lemma, chartaceous, without keels, 5 -veined, pubescent, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 2 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, geniculate, 6–7 mm long. Fertile lemma orbicular, 3.5–4 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Malawi.

Anthoxanthum flexuosum (Hook. f.) J.F. Veldkamp. *Blumea*, 30(2): 347 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from Sikkim. **Basionym or Replaced Name:** *Hierochloe flexuosum* Hook. f., *Fl. Brit. India* 7(21): 222 (1897) [1896]. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *King's collector s.n.*, Sikkim: Bijean (K).

Recent Synonyms: *Hierochloe flexuosa* Hook. f., *Fl. Brit. Ind.* 7: 222. (1896).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (591, Fig. 23).

Derivation (Clifford & Bostock 2007): *L. flecto*, bend; *-osa*, abundance. Inflorescence branches lax and drooping or bent in a zigzag fashion.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long. Ligule an eciliate membrane. Leaf-blades 5–12 cm long, 2–4 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 5–8 cm long. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 5 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume ovate, 5 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5 mm long, chartaceous, 1-keeled, 5 -veined, pubescent, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret 1.5 mm long. Lemma of upper sterile floret oblong, 5 mm long, chartaceous, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.5 way up back of lemma, geniculate, 5–6 mm long. Fertile lemma ovate, 3.5 mm long, chartaceous, without keel, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male), 1.5 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Eastern Himalaya. Bhutan, Sikkim.

Anthoxanthum glabrum (Trin.) J.F. Veldkamp. *Blumea*, 30(2): 347 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Hierochloe*).

TYPE from Italy. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Italy,.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. slender. Culms or inflorescences slender.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 10–22 cm long. Lateral branches lacking or sparse. Leaf-sheaths loose or inflated, glabrous on surface. Ligule an eciliate membrane, 1.2–4 mm long, acute. Leaf-blades 1–7.5 cm long, 2–7 mm wide, aromatic. Leaf-blade margins ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, comprising 4–9 fertile spikelets. Panicle contracted, linear or oblong, 1.5–3.5 cm long, 0.6–2 cm wide, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, ciliate.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 9–10 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 5.5–6.5 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, 4 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 6.5–9 mm long, 2.4–2.8 length of fertile lemma, chartaceous, without keels, 3 -veined, pilose, hairy below, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pilose, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, geniculate, 20–22 mm long. Fertile lemma orbicular, 2.7–3.2 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, ellipsoid. Embryo 0.25 length of caryopsis. Hilum punctiform.

$2n = 10$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southwestern Europe, Southeastern Europe.

Country /Province /State. : Sardinia. : Albania, Greece, Italy, Crete, Malta, Sicily. **Northern Africa.** Tunisia. **Western Asia.** East Aegean Is.

Anthoxanthum gunckelii (Parodi) J.F. Veldkamp. *Blumea*, 30(2): 348 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. **Basionym or Replaced Name:** *Hierochloe gunckelii* parodi, *Revista Mus. La Plata, Secc. Bot.* 3(14): 197, f. 5–6 (1941)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Parodi 13643*, Sep 1940, Cultivated from Gunckel s.n. collected in Chile, Depto. Valdivia, Corral (Amargos) (BAA; IT: SI (fragm. ex BAA & photo)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (136), M.N.Corraea, *Flora Patagonica* Parte III, Gramineae (1978) (291, Fig. 189 as *Hierochloa*).

Derivation (Clifford & Bostock 2007): in honor of H. Gunckel (fl. 1931) who collected in Chile.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Basal innovations extravaginal. Culms 50–100 cm long. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, obtuse. Leaf-blades convolute, 15–35 cm long, 5–7 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, equilateral or nodding, 12–25 cm long. Primary panicle branches 1–2 -nate, 5–7 cm long. Panicle axis smooth or scaberulous. Panicle branches pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 1.5 mm long. Floret callus pilose.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 5–6 mm long, 0.8 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein smooth or scaberulous. Lower glume apex acute. Upper glume ovate, 6–7 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins all falling short of apex. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 5.5–7 mm long, chartaceous, 1-keeled, 5 -veined, scabrous, eciliate on midvein or ciliolate on midvein, eciliate on margins or ciliolate on margins, fringed below, obtuse, awned. Awn of lower sterile floret subapical, 1 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.33 way up back of lemma, straight, 2 mm long. Fertile florets female. Fertile lemma ovate, 4.3–4.8 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma midvein eciliate or ciliolate. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea linear, 1 -veined, without keels.

Flower and Fruit. Anthers 3, 3.5 mm long. Staminodes two present. Ovary glabrous. Caryopsis with adherent pericarp, fusiform, 1.5 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile Central, Chile South. Río Negro. Biobio, La Araucania. Los Lagos.

Anthoxanthum hirtum (Schrank) Y. Schouten & Veldkamp. *Blumea* 30(2): 348 (1985).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Hierochloe*).

Basionym or Replaced Name: *Savastana hirta* Schrank, *Baier. Fl.* 1: 337 (1789). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Germany, Bavaria, Fohring: Wellmann (M neo).

Recent Synonyms: *Hierochloe hirta* (Schrank.) Borb., *A Balaton Floraja* :315 (1900).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (763).

Derivation (Clifford & Bostock 2007): L. hairy. Hairy in part or extensively.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Country /Province /State. Central European Russia.

Anthoxanthum hookeri (Griseb.) Rendle. *Journ. Linn. Soc.* 6: 380 (1904).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Sikkim. **Basionym or Replaced Name:** *Ataxia hookeri* Griseb., *Nachr. Ges. Wiss. Gottingen, Math.-Phys. Kl.* 77 (1868). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Sikkim: 2743–3658 m, *J.D. Hooker* 2 (HT: ?; IT: L).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (591, Fig. 23), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 456).

Derivation (Clifford & Bostock 2007): in honor of Joseph Dalton Hooker (1817–1911), English botanist, traveller and Garden's Director.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, weak, 15–70 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades 8–16 cm long, 2–5 mm wide, flaccid.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, loose or effuse, 4–17 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 6 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 0.2 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 3.5 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume ovate, 6 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acuminate.

Florets. Basal sterile florets 2 or more, dissimilar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5.5 mm long, chartaceous, without keels, 5 -veined, pilose, dentate, 2 -fid, awned. Awn of lower sterile floret dorsal, arising 0.5 way up back of lemma, 1.5 mm long. Lemma of upper sterile floret oblong, 5.5 mm long, chartaceous, pilose, lobed, 2 -fid, awned. Awn of upper sterile floret dorsal, arising 0.2 way up back of lemma, geniculate, 9–10 mm long. Fertile lemma oblong, 3 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2.5 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Tibet. **Indian Subcontinent, Indo-China.** Eastern Himalaya, India, Nepal. Myanmar.

Guizhou, Sichuan, Yunnan. Bhutan, Sikkim. Tamilnadu.

Anthoxanthum horsfieldii (Bennet) Reeder. *J. Arn. Arb.* 24:325 (1950).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China 22* (Poaceae) (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A. clarkei*).

TYPE from Indonesia. **Basionym or Replaced Name:** *Ataxia horsfieldii* Kunth ex Benn., *Pl. Jav. Rar.* 8, pl. 3 (1838)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Indonesia: Java:, *Horsfield 339* (HT: BM; IT: K, L, P).

Recent Synonyms: *Anthoxanthum clarkei* (Hook. f.) Ohwi, *Bull. Tokyo Sci. Mus.*, No. 18, 8 (1947).

Illustrations (Books): E.E.Henty, *A Manual of the Grasses of New Guinea* (1969) (27, Pl. 3 as *A. angustum*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 456).

Derivation (Clifford & Bostock 2007): in honor of Thomas Horsfield (1773–1859) United States physician and naturalist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 50–105 cm long. Culm-internodes thin-walled, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths glabrous on surface, outer margin hairy. Ligule an eciliate membrane, 0.7–2 mm long. Leaf-blades 15–37 cm long, 5–10 mm wide, flaccid, aromatic. Leaf-blade surface glabrous, hairless throughout or except near base. Leaf-blade margins glabrous or ciliate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, elliptic, continuous or interrupted, 3.5–13.5 cm long, 0.7–2.2 cm wide. Primary panicle branches 1–3 -nate, 1.5–5.4 cm long, bearing 5–28 fertile

spikelets on each lower branch. Panicle axis glabrous. Panicle branches glabrous or pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4.5–7.4 mm long, 1.3–2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 2.7–5.1 mm long, 0.5–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein eciliate or ciliolate. Lower glume lateral veins absent. Lower glume apex obtuse or acute. Upper glume obovate, 4.4–7.3 mm long, 1.6–2.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein eciliate or ciliolate. Upper glume apex acute or acuminate.

Florets. Basal sterile florets 2 or more, dissimilar, male or barren, with palea or without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 3.7–6.4 mm long, membranous, without keels, 5 -veined, pubescent, hairy below, ciliate on margins, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, arising 0.6–0.8 way up back of lemma, 0.4–2.75 mm long. Lemma of upper sterile floret oblong, 3.6–5.8 mm long, membranous, pubescent, ciliate on margins, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.25–0.5 way up back of lemma, geniculate, 4–9.2 mm long. Fertile lemma oblong, 2.3–3.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex emarginate, muticous or mucronate or awned, 1 -awned. Principal lemma awn 0–3.5 mm long overall. Palea linear, 2–3.4 mm long, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 1.8–3.6 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, lanceolate or oblong, 1.6–2.2 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China, Eastern Asia. China South Central. Japan, Taiwan. **Indian Subcontinent, Indo-China, Malesia, Papuasias.** Assam, India. Myanmar, Thailand. Borneo, Java, Moluccas, Philippines, Sumatra. New Guinea PNG, or West Papua (Irian Jaya). New Guinea.

Guizhou. Meghalaya.

Anthoxanthum japonicum (Maxim.) Hackel ex Matsumura. *Bot. Mag., Tokyo*, 11:443 (1897).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. **Basionym or Replaced Name:** *Hierochloe japonica* Maxim., *Bull. Acad. Sci. St. Petersb.* 32: 626 (1888). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Japan, Mt. Haku-san: Yatabe (LE holotype).

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (224, Fig. 81), C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (254 as *A. formosanum*), C-C Hsu, *Taiwan Grasses* (1975) (406, Pl. 1378 as *A. formosanum*).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to; Japan, a modified spelling Zhapan introduced into Europe by Marco Polo as a transliteration for the Chinese name for the large islands to the east of that country. From Japan.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes short. Culms slender, 26–65 cm long, 1–1.2 mm diam., 3–5 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 2–6 mm long, truncate or obtuse or acute. Leaf-blades linear or lanceolate, 12–20 cm long, 4–10 mm wide, aromatic. Leaf-blade surface smooth, pubescent, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, loose, 5–10 cm long, 1–3.5 cm wide. Primary panicle branches 2 -nate, 1–3 cm long. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or oblong, laterally compressed, compressed slightly, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 0.7–1 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3–4 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5–7 mm long, chartaceous, without keels, 5 -veined, pilose, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, arising 0.5 way up back of lemma, 1.5–2 mm long. Lemma of upper sterile floret oblong, 5–7 mm long, chartaceous, pilose, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.25 way up back of lemma, geniculate, 4–5 mm long. Fertile lemma elliptic or ovate, 2.5–3 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex emarginate. Palea oblong, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–2.5 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 70$ (1 ref TROPICOS).

Distribution (TDWG). Temperate Asia.

Country /Province /State. China, Eastern Asia. Japan Shikoku. Japan, Taiwan.

Anthoxanthum juncifolium (Hack.) J.F. Veldkamp. *Blumea*, 30(2): 348 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Hierochloe utriculata* var. *juncifolia* Hack., *Anales Mus. Nac. Buenos Aires* 21: 64 (1911)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *N. Illin* 222, 20–25 Mar 1901, Argentina: Chubut: Dep. Languiño: region del Río Corcovado (W; IT: BAA, BAF, LPS-2543, SI, US-990307).

Recent Synonyms: *Hierochloe juncifolia* (Hack.) L. Parodi, *Not. Mus. La Plata, Bot.*, 3: 27 (1938).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (137), M.N.Correra, *Flora Patagonica* Parte III, Gramineae (1978) (284, Fig. 184 as *Hierochloe juncifolia*).

Derivation (Clifford & Bostock 2007): *L. juncea*, rush-like; *folium*, leaf. With rush-like leaf-blades or culms.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Culms 30–80 cm long. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous. Ligule a ciliolate membrane, 1–4 mm long, obtuse. Leaf-blades filiform, convolute, 7–35 cm long, 1–2 mm wide, stiff. Leaf-blade surface puberulous, hairy adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle spiciform, linear, continuous, 6–10 cm long. Panicle axis scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous, pubescent, hairy at tip.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 5.5–6.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acute. Upper glume ovate, 5.5–6.5 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 5–6.5 mm long, chartaceous, 1-keeled, 5 -veined, ciliolate on margins, obtuse, mucronate. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, ciliolate on margins, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.75 way up back of lemma, geniculate, 1.5–4 mm long. Fertile florets female. Fertile lemma ovate, 4–4.5 mm long,

cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea linear, 1 -veined, without keels.

Flower and Fruit. Anthers 3, 2.5–4 mm long. Staminodes two present. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Argentina South, Chile Central, Chile South.

Chubut, Neuquén, Río Negro. La Araucania. Los Lagos.

Anthoxanthum latifolium B.S.Sun & S.Wang. *Bull. Bot. Res. North-East. Forest. Inst.*, 10(4): 16 (1990).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Yunnan: Yongde, on ridge, 2750 m, 29 Aug. 1987, B.S. Sun & Y.C. Wang 89019 (HT: YUNU).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. latus*, broad; *folium*, leaf. Leaf-blades broad or relatively broad with respect to related species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.

Yunnan.

Anthoxanthum laxum (Hook. f.) J.F. Veldkamp. *Blumea*, 30(2): 348 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from India. **Basionym or Replaced Name:** *Hierochloe laxa* R. Br. ex Hook. f., *Fl. Brit. India* 7(21): 222 (1897)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *Wallich* 3796, 1848, India Orient. (LE). *H. laxa* R.Br. ex Hook.f.. LT: *Thomson s.n.*, NW Himalaye: temperate region, 3050–3960 m (K; ILT: L). LT designated by ?; cited by Schouten & Veldkamp, *Blumea* 30: 348 (1985).

Recent Synonyms: *Hierochloe laxa* Hook. f., *Fl. Brit. India* 7:222 (1896).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. loose*. Inflorescence much branched either as a single panicle or from branching of the culms.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 20–75 cm long. Ligule an eciliate membrane, 0.75–2.5 mm long. Leaf-blades 2.5–17 cm long, 4–14 mm wide, aromatic. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 5–16 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 4–7 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume ovate, 4–7 mm long, 1.3–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 4.5–5.5 mm long, 1.5 length of fertile lemma, membranous, 1-keeled, 5 -veined, ciliolate on margins, emarginate or truncate, awned. Awn of lower sterile floret dorsal, 0.5–3 mm long. Fertile lemma ovate, 3–4 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea,

ciliate. Lemma apex acute, mucicous or awned, 1 -awned. Principal lemma awn 0–2 mm long overall. Palea elliptic, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male). Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Western Asia, China. Iran. **Indian Subcontinent.** Pakistan. Sikkim. Uttah Pradesh. Himachal Pradesh, Jammu Kashmir.

Anthoxanthum madagascariense Stapf. *Kew Bull.* 1897, 287. (1897).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar., *Baron 2050, 4098* (ST: K).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (62, Fig. 12).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Madagascar.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths herbaceous. Culms erect, 15–60 cm long. Lateral branches lacking. Leaf-sheaths smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 1–2 mm long, truncate. Leaf-blades 2.5–10 cm long, 3–4 mm wide, stiff, aromatic. Leaf-blade surface smooth or scaberulous, glabrous. Leaf-blade margins ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 3–8 cm long. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–4.5 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 5–5.5 mm long, 2.5 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 4.5 mm long, chartaceous, without keels, 5 -veined, pubescent, emarginate, awned. Awn of lower sterile floret 1 mm long. Lemma of upper sterile floret oblong, 4.5 mm long, chartaceous, pubescent, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.5 way up back of lemma, geniculate, 4–5 mm long. Fertile lemma oblong, 2 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Anthoxanthum mexicanum (Fourn.) Hitchc. Fedde, *Repert.* 17: 291 (1921).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Ataxia mexicana* Rupr. ex E. Fourn., *Mexic. Pl.* 2: 71 (1886)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *Galeotti 5756*, Mexico (BR; ILT: US-865363 (fragm. ex BR)). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 17(3): ? (1913).

Recent Synonyms: *Hierochloe mexicana* (Fourn.) Hitchc., *Contrib. US Nat. Herb.* 24:614 (1930).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating origin. From Mexico.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 40–70 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades 5–15 cm long, 2–4 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, interrupted, 6–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 0.2 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5–4 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume oblong, 5–6 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume surface asperulous. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5 mm long, chartaceous, without keels, 5 -veined, pubescent, bearing tawny hairs, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, arising 0.75 way up back of lemma, 1–1.5 mm long. Lemma of upper sterile floret oblong, 5 mm long, chartaceous, pubescent, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.25 way up back of lemma, geniculate, 6–7 mm long. Fertile lemma oblong, 2.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Southwest Mexico, Southeast Mexico. Mesoamerica, Northern South America. Guatemala.

Oaxaca. Chiapas.

Anthoxanthum monticola (Sw.) Roem. & Schult. *Syst.* ii. 515. (1817).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe alpina*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Hierochloe alpina*), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Hierochloe alpina*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (as *Hierochloe alpina*).

TYPE from Sweden. **Basionym or Replaced Name:** *Holcus alpinus* Sw. ex Willd., *Sp. Pl.* 4(2): 937 (1806)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Liljeblad in Swartz hb.*, Lapland (B-W-18699; IT: S). LT (at S) designated by G. Weimarck, *Bot. Not.* 134: 157 (1971) as S, but Willd. specimen would seem to be the HT [rjs].

Recent Synonyms: *Anthoxanthum monticulum* (Bigelow) Veldkamp, *Blumea* 30(2): 347 (1985).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (761 as *Anthoxanthum monticola*).

Derivation (Clifford & Bostock 2007): L. *alpes*, high mountain; *-ina*, belonging to. Species growing at high altitudes.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms 20–40 cm long. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane, 0.6 mm long. Leaf-blades involute, 1–2 mm wide, aromatic. Leaf-blade surface pubescent, hairy abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 1.5–4.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5–8 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 5–8 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume ovate, 5–8 mm long, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 1 length of fertile lemma, chartaceous, 1-keeled, 5 -veined, pubescent, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret 2–4 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret geniculate, 4–8 mm long. Fertile lemma ovate, 5–8 mm long, cartilaginous, without keel, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male), 1.2 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe, Temperate Asia, North America.

Region. Northern Europe, Eastern Europe.

Country /Province /State. : Finland, Norway, Svalbard, Sweden. North European Russia. Anthoxanthum nitens (Weber) Y. Schouten & Veldkamp. *Blumea*, 30(2): 348 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987) (as *Hierochloe*).

TYPE from Germany. **Basionym or Replaced Name:** *Holcus odoratus* L., *Sp. Pl.* 2: 1048 (1753)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: Europe (LINN-1212.14, second specimen from the left). LT designated by Weimarck, *Bot. Not.* 124: 136 (1971).

Recent Synonyms: *Hierochloe odorata* (L.) Beauv., *Agrost.* t. 12. f. 5 (1812). *Poa nitens* Weber, *Prim. Fl. Holsat.* Suppl. 2: no. 6 (1787).

Illustrations (Books): C.E.Hubbard, *Grasses* (1968), T. Cope & A. Gray, *Grasses of the British Isles* (86), N.N.Tsvelev, *Grasses of the Soviet Union* (1983) (523 (351), Pl.6 as *Hierochloe odorata*), T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (220, Fig. 79 as *Hierochloe odorata*), M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (as *Anthoxanthum hirtum* & *A. nitens*), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 455).

Derivation (Clifford & Bostock 2007): *L. niteo*, shine. Spikelets or lemmas glossy at maturity.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect, 20–50 cm long. Ligule an eciliate membrane, 1.5–5(–6.5) mm long. Leaf-blades 18–30 cm long, 4–10 mm wide, aromatic. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 4–11 cm long. Primary panicle branches spreading, 2–4.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–4 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma, shiny. Lower glume ovate, 4–6 mm long, 1 length of upper glume, membranous, 1-keeled,

1–3 -veined. Lower glume apex obtuse. Upper glume ovate, 4–6 mm long, 1.2–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 3.5–4.5 mm long, 1.2 length of fertile lemma, membranous, 1-keeled, 5 -veined, puberulous, ciliolate on margins, obtuse. Palea of lower sterile floret scabrous. Fertile lemma ovate, 3 mm long, cartilaginous, shiny, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 0.8 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male), 1–3 mm long (bisexual 1–2mm, male 2–3mm). Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp, ellipsoid. Embryo 0.5 length of caryopsis. Hilum linear.

Distribution (TDWG). **Continent.** Europe, Temperate Asia, North America.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe, and Eastern Europe.

Country /Province /State. : Great Britain. : Germany. Belarus, Baltic States, Central European Russia, North European Russia, South European Russia, Moldova, Ukraine. Siberia, Russian Far East, **Middle Asia, Caucasus, Western Asia, China, Mongolia, Eastern Asia,** and **Russia.** Altay, Buryatiya, Chita, Irkutsk, Krasnoyarsk, Tuva, West Siberia, Yakutiya. Gansu, Hebei, Shaanxi, Shandong, Shanxi. Henan. Guizhou, Sichuan, Yunnan.

Anthoxanthum nivale K. Schum. *Engl. Pflanzenw. Ost-Afr. C* 107. (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Tanzania. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: ST: *Volkens 975*, Tanzania: Mount Kilimanjaro (K). ST: *Volkens 1154*, Tanzania (B).

Illustrations (Books): H.Jacques-Felix, *Les Graminees d'Afrique tropicale* (1962) (131, Fig. 55), R.M.Phill, F.T.E.A., *Gramineae* (1(1970):78, Fig. 26).

Derivation (Clifford & Bostock 2007): *L. nix*, snow; *-ale*, pertaining to. Growing near to permanent snow line.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths papery, persistent and investing base of culm, with soft dead sheaths. Culms erect, 25–90 cm long. Leaves mostly basal. Ligule an eciliate membrane, 5 mm long. Leaf-blades 8–25 cm long, 4–10 mm wide, aromatic. Leaf-blade surface glabrous or pubescent, hairy on both sides. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or oblong, continuous or interrupted, 5–15 cm long, 1–1.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 4–5 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume elliptic, 7–9 mm long, 3–4 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 3 -veined. Upper glume primary vein smooth or scabrous. Upper glume apex acuminate.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 3.5–5 mm long, 1.5–2 length of fertile lemma, membranous, without keels, 5 -veined, pilose, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, arising 0.6 way up back of lemma, 1–3 mm long. Lemma of upper sterile floret oblong, 3.5–5 mm long, 1 length of lower sterile floret, membranous, pilose, lobed, 2 -fid, obtuse, awned. Awn of upper

sterile floret dorsal, arising 0.33 way up back of lemma, geniculate, 5–8 mm long. Fertile lemma orbicular, 2.5 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–4.5 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, ellipsoid. Embryo 0.33 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Rwanda, DRC. Kenya, Tanzania, Uganda.

Anthoxanthum occidentale (Buckl.) J.F. Veldkamp. *Blumea*, 30(2): 348 (1985).

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Nuttall s.n.*, USA: Oregon: Columbia woods (PH; IT: US- (fragm. ex PH & photo 63; fragm. ex PH & photo rt 62)).

Recent Synonyms: *Hierochloe occidentalis* Buckl., *Proc. Acad. Sc. Philad.* 1862 :100 (1863). *Hierochloa odorata* (L.) Beauv. (1812).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (763).

Derivation (Clifford & Bostock 2007): *L. occident*, west; *-ale*, pertaining to.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 60–90 cm long. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 3–6 mm long, pubescent on abaxial surface, erose, obtuse or acute. Leaf-blades 20–40 cm long, 7–12 mm wide, aromatic. Leaf-blade venation prominent, with distinct cross veins. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 8–13 cm long, bearing few spikelets. Primary panicle branches drooping. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, shiny. Lower glume ovate, 4 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume ovate, 4 mm long, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 4.5 mm long, 0.9 length of fertile lemma, chartaceous, 1-keeled, 5 -veined, puberulous, ciliate on margins, dentate, 2 -fid, obtuse, muticous or mucronate. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pubescent, ciliate on margins, lobed, 2 -fid, obtuse, muticous or mucronate. Fertile lemma ovate, 4.5 mm long, cartilaginous, shiny, without keel, more than 3-veined. Lemma surface puberulous, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male), 2.5 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, Southwestern USA. Oregon, Washington. California.

Derivation (Clifford & Bostock 2007): *L. odora*, fragrance; *-ata*, possessing. Strongly scented with coumarin.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths papery, withering. Culms erect or geniculately ascending, 10–75(–100) cm long, 1–3 -noded. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane, 1–5(–7) mm long. Leaf-blades 1–12(–30) cm long, 1.5–5(–9) mm wide, aromatic. Leaf-blade surface glabrous or pubescent, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong or ovate, continuous or interrupted, 1–12 cm long, 0.6–1.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.5–1 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 7–9.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 3.7–5.2 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume surface pubescent. Lower glume apex acuminate. Upper glume elliptic, 7–9.5 mm long, 3–5 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled, 3 -veined. Upper glume primary vein smooth. Upper glume surface pubescent. Upper glume apex acuminate.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 2.8–3.6 mm long, 1.5–2 length of fertile lemma, membranous, without keels, 4–5 -veined, pilose, emarginate, awned. Awn of lower sterile floret

dorsal, arising 0.6 way up back of lemma, 2–4 mm long. Lemma of upper sterile floret oblong, 3–3.5 mm long, 1 length of lower sterile floret, membranous, pilose, emarginate, awned. Awn of upper sterile floret dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 6–9 mm long. Fertile lemma orbicular, 1.7–2.4 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, (2.9–)3.5–4.8(–5.5) mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp, ellipsoid, 2 mm long. Embryo 0.33 length of caryopsis. Hilum punctiform.

$n = 4$ (4 refs TROPICOS). $2n = 10$ (2 refs TROPICOS), or 20 (13 refs TROPICOS).

Country /Province /State. : GB Aliens (Ryves et al).

Anthoxanthum pallidum (Hand.-Mazz.) Tzvelev. *Rast. Centr. Azii, Mater. Bot. Inst. Komarov* 4: 35 (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Basionym or Replaced Name: *Hierochloe pallida* Hand.-Mazz., *Anz. Akad. Wiss. Wien*, 57: 273 (1920).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. pale-colored. Spikeletes or grain pale-green.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 7–16 cm long. Culm-nodes bearded. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades convolute, 2–5 cm long, 1–2 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 2.5–4 cm long, 0.4–0.5 cm wide. Primary panicle branches 1–2 -nate, 0.5–1 cm long, bearing 1–5 fertile spikelets on each lower branch. Panicle branches pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets obovate, laterally compressed, 3 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 1.5 mm long, 0.5–0.6 length of upper glume, membranous, pallid, 1-keeled, 3 -veined. Lower glume surface pubescent. Lower glume apex acute. Upper glume ovate, 3 mm long, 2 length of adjacent fertile lemma, membranous, pallid, 1-keeled, 3 -veined. Upper glume surface pubescent. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret linear, membranous, light brown, without keels, scaberulous, puberulous, dentate, 2 -fid. Lemma of upper sterile floret linear, membranous, scabrous, pubescent, dentate, 2 -fid, awned. Awn of upper sterile floret dorsal, 1 mm long. Fertile lemma ovate, 1.5 mm long, cartilaginous, dark brown, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 3 mm long. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Sichuan, Yunnan.

Anthoxanthum pauciflorum Adam. *Denkschr. Akad. Wien, Math. Nat.* 74: 116. (1904).

Accepted by: T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Hierochloa pauciflora*).

TYPE from ?China. **Basionym or Replaced Name:** *Hierochloe pauciflora*. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *Montium Babuna-Planina et Kajmakcalan (Nidze-Planina), Dom Pilcz s.n.*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. paucus*, few; *flos*, flower. Florets few per spikelet.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, 15–30 cm long. Culm-internodes smooth or scaberulous. Leaves mostly basal, much reduced on the culm. Leaf-sheaths scaberulous. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blades 10–20 cm long, 1–2 mm wide, aromatic. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 1.5–3 cm long, bearing few spikelets. Primary panicle branches appressed, bearing 1–2 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, shiny. Lower glume ovate, 2.5 mm long, 0.75 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 3.5–4.5 mm long, 0.9 length of adjacent fertile lemma, hyaline, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 1 length of fertile lemma, membranous, 1-keeled, 5 -veined, scabrous, entire, acute, mucicous or mucronate. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, membranous, scabrous, entire, acute, mucicous or mucronate. Fertile lemma ovate, 4–5 mm long, cartilaginous, without keel, more than 3-veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 3 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male). Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Country /Province /State. North European Russia. Siberia, **Middle Asia. Subarctic America, Eastern Canada.**

Anthoxanthum pluriflorum (Koidz.) J.F. Veldkamp. *Blumea*, 30(2): 349 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from Japan. **Basionym or Replaced Name:** *Hierochloe pluriflora* Koidz, *Bot. Mag. (Tokyo)* 31: 136 (1917)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: topo T: *Ohwi J. 8 5155*, Jul 1934, Japan: Jeso: Mt. Yubari (LE). HT: *Koidzumi s.n.*, 1916, Japan: Hokkaido: Prov. Ishikari, Mt. Yubaridake (KYO).

Recent Synonyms: *Hierochloe pluriflora* Koidz., *Bot. Mag., Tokyo*, 31: 136 (1917).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. plus*, several; *flos*, flower. Florets several per spikelet.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated. Culms 18–40 cm long, 1–1.2 mm diam. Ligule a ciliolate membrane. Leaf-blades involute, 25–40 cm long, 4–6 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 2–3 cm long, 1–1.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 5–6 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex obtuse. Upper glume ovate, 5–6 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 4.5–5.5 mm long, chartaceous, 1-keeled, 5 -veined, pubescent, ciliate on margins, obtuse, mucicous or mucronate or awned. Awn of lower sterile floret 0–2 mm long. Lemma of upper sterile floret oblong, 4.5–5.5 mm long, chartaceous, pubescent, ciliate on margins, mucicous or mucronate or awned. Fertile lemma ovate, 4–5 mm long, cartilaginous, without keel, more than 3-veined. Lemma surface pubescent, hairy at base. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male). Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan Hokkaido. Japan.

Anthoxanthum potaninii (Tzvelev) S.M. Phillips & Z.L. Wu. *Novon* 15(3): 476. 2005.

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006) (as *Hierochloa*).

TYPE from China. **Basionym or Replaced Name:** *Hierochloe potaninii* Tzvelev, Rast. Tsentr. Asii 4:35 (1968). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: W Gansu: Lidsha-Pu, 20 June 1885, *G. Potanin s.n.* (HT: LE).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 455).

Derivation (Clifford & Bostock 2007): In honor of Grigorij Nikolajevic Potanin (1835–1920) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes short. Culms erect, 50–120 cm long. Culm-internodes smooth. Leaf-sheaths smooth or scaberulous, glabrous on surface. Ligule an eciliate membrane, 4–8 mm long. Leaf-blades flat, 8–15 cm long, 6–14 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 12–22 cm long, 2–6 cm wide. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 4–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 2–4 mm long, 0.5–0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth, glabrous. Lower glume apex obtuse or acute. Upper glume lanceolate, 3–6 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein smooth. Upper glume surface glabrous. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret lanceolate, 4–6 mm long, chartaceous, 1-keeled, 5 -veined, scabrous, ciliolate on margins, emarginate. Lemma of upper sterile floret lanceolate, 4–6 mm long, chartaceous, scabrous, ciliate on margins, emarginate, awned. Awn of upper sterile floret 2–4 mm long. Fertile lemma lanceolate, 3 mm long, cartilaginous, shiny, without keel. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea 1 -veined, without keels.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male), 2–3.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China North-Central.
Gansu.

Anthoxanthum pusillum (Dusen) J.F. Veldkamp. *Blumea*, 30(2): 349 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. **Basionym or Replaced Name:** *Hierochloe pusilla* Hack. ex Dusén, *Ark. Bot.* 7(2): 4, t. 1, f. 7 (1907). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Dusen 5999*, Argentina: Santa Cruz: Río Chico, Río Fósiles, 900 m (S; IT: BAA (fragm. ex S), US (fragm. ex W), W).

Recent Synonyms: *Hierochloe pusilla* Hackel ex Dusen, *Arkiv Bot. Stockh.* 7 No. 2, 4 (1907).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 2 Pooideae* (2012) (138).

Derivation (Clifford & Bostock 2007): L. very small. Plants of small stature.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 5–10 cm long. Leaf-sheaths inflated, pubescent. Ligule an eciliate membrane, erose, truncate. Leaf-blades curved, flat or conduplicate, 1–3 cm long, 2–3 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle pubescent above. Panicle spiciform, oblong, 1–2 cm long, 0.7–1 cm wide, bearing few spikelets. Panicle axis smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent, hairy at tip.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 4.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 4.5–5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein extending to apex. Lower glume apex obtuse. Upper glume ovate, 4.5–5 mm long, membranous, 1-keeled, 3 -veined. Upper glume lateral veins all falling short of apex. Upper glume apex obtuse.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 5 mm long, chartaceous, 1-keeled, 5 -veined, scaberulous, rough above, truncate or obtuse, muticous. Palea of lower sterile floret 3.5 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, scabrous, truncate or obtuse, muticous. Fertile florets female. Fertile lemma ovate, 3–3.5 mm long, cartilaginous, light brown, without keel, 5 -veined, more than 3-veined. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea linear, 1 -veined, without keels.

Flower and Fruit. Anthers 3, 2.5 mm long. Stamynodes two present. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile South.
Santa Cruz, Tierra del Fuego. Magallanes.

Anthoxanthum rariflorum (Hook. f.) J.F. Veldkamp. *Blumea*, 30(2): 349 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from Australia. **Basionym or Replaced Name:** *Hierochloe rariflora* Hook. f., *Fl. Antarct.* 1: 93 (1844)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Hooker s.n.*, Australia (K).

Recent Synonyms: *Hierochloe rariflora* Hook. f., *Fl. Antarct.* 93. (1844).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rarus*, far apart; *flos*, flower.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Cataphylls evident. Basal innovations extravaginal. Culms geniculately ascending or decumbent, 60–100 cm long, wiry. Lateral branches ample. Ligule an eciliate membrane, 1 mm long. Leaf-blades deciduous at the ligule, flat or convolute, 10–20 cm long, 2–9 mm wide, aromatic. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 4–10 cm long, 3–8 cm wide. Primary panicle branches branching divaricately. Panicle branches capillary, puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, puberulous.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 2.5 mm long, 1 length of upper glume, herbaceous, 1-keeled, 3 -veined. Lower glume margins ciliate. Lower glume apex obtuse. Upper glume oblate, 2.5 mm long, 0.5 length of adjacent fertile lemma, herbaceous, 1-keeled, 3 -veined. Upper glume margins ciliate. Upper glume apex obtuse.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 4.5–5 mm long, 1 length of fertile lemma, membranous, 1-keeled, 5 -veined, scaberulous, rough above, ciliolate on margins, obtuse, muticous. Fertile lemma ovate, 4.5–5 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male). Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland, New South Wales, A.C.T., Victoria, Tasmania.

Anthoxanthum redolens (Vahl) P. van Royen. *Alp. Fl. New Guinea*, 2: 1185 (1979).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Tierra del Fuego. **Basionym or Replaced Name:** *Holcus redolens* Vahl, *Symb. Bot.* 2: 102 (1791)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: [*J.R. & G. Forster*] *Fabricius [misit]*, 20 Dec. 1774 – 3 Jan. 1775, Terra del Fuego (C; IT: BM-FORST, K (p.p. Tierra del Fuego)). "Vahl index card: Habitat in terra del fuego Prof Fabricius." This is a Forster collection sent to Vahl by Dr. Fabricius, of Kiel. See Hansen & Wagner, *Allertonia* 7: 345 (1998). The province of the C specimen has been argued to be New Zealand by Zotov [who saw a photo] (1973), or Fuegian by De Paula (1975).

Recent Synonyms: *Hierochloe redolens* (Vahl) Roem. & Schult., *Syst.* 2: 514. (1817).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (139).

Derivation (Clifford & Bostock 2007): *L. redoleo*, give off an odor. Inflorescences smell of coumarin.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms erect, 50–100 cm long, 4–5 -noded. Culm-nodes glabrous. Lateral branches lacking. Ligule an eciliate membrane, 4–9 mm long, obtuse. Leaf-blades 15–45 cm long, 5–12 mm wide, stiff, aromatic. Leaf-blade surface ribbed (deeply), scaberulous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–20 cm long. Primary panicle branches 2 -nate, 5–10 cm long. Panicle branches capillary, pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–7 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets or exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 5–8 mm long, 1 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse or acute. Upper glume ovate, 5–8 mm long, 1.1–1.8 length of adjacent fertile lemma, hyaline, 1-keeled, 3 -veined. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 6.5 mm long, 1.5 length of fertile lemma, chartaceous, 1-keeled, 5 -veined, scaberulous, ciliolate on margins, obtuse, awned. Awn of lower sterile floret dorsal. Fertile lemma ovate, 4.5 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male), 1.5–3.5 mm long. Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** Tropical Asia, Australasia, South America, Antarctica.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. repo*, crawl. Rhizome well developed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, mat forming. Rhizomes elongated. Butt sheaths grey. Culms 20–50 cm long. Ligule an eciliate membrane, 2–3.5 mm long. Leaf-blades 7–9 mm wide, pruinose, aromatic.

Inflorescence. Inflorescence a panicle, comprising 120–160 fertile spikelets. Panicle open, ovate, 6.5–10 cm long. Primary panicle branches 1–2 -nate. Panicle axis 11–12 noded. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, puberulous, hairy at tip, with 0.1–0.3 mm long hairs.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 3.4–4.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.3–0.6 mm long.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 3.4–4.2 mm long, 1 length of upper glume, membranous, 1-keeled. Lower glume apex acute. Upper glume ovate, 3.4–4.7 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-keeled. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 3.3–3.8 mm long, chartaceous, 1-keeled, 5 -veined, ciliate on margins, entire or dentate, 2 -fid, mucronate or awned. Awn of lower sterile floret terminal or subapical, 0.2–0.5 mm long. Lemma of upper sterile floret oblong, 3.3–3.8 mm long, chartaceous, ciliate on margins, entire or dentate, 2 -fid, mucronate or awned. Awn of upper sterile floret terminal or subapical, straight, 0.2–0.5 mm long. Fertile lemma ovate, 2.5–3.5 mm long, cartilaginous, without keel, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea 1 -veined, without keels.

Flower and Fruit. Anthers 2 (bisexual) or 3 (male), 1.6–2.7 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Middle Europe, Southeastern Europe, Eastern Europe.

Country /Province /State. : Austria, Czechoslovakia, Hungary. : Bulgaria, Romania. Central European Russia, East European Russia, Northwest European Russia. **Caucasus.** North Caucasus.

Anthoxanthum sikkimense (Maxim.) Ohwi. *Bull. Tokyo Sci. Mus., No. 18, 8* (1947).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Hierochloe sikkimensis* Maxim., *Bull. Acad. Sci. St. Petersburg.* 32: 626 (1888). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Sikkim: 3353–3658 m, *J.D. Hooker 1* (HT: ?; IT: L).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (591, Fig. 23).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Sikkim.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms weak, 15–30 cm long. Lateral branches lacking. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 2 mm long, erose. Leaf-blades 5–10 cm long, 1–2 mm wide, flaccid, aromatic. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 2–5.5 cm long, 1 cm wide. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 5.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 5.5 mm long, 1.5 length of adjacent fertile lemma, membranous, with scarious margins, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate, mucronate.

Florets. Basal sterile florets 2 or more, dissimilar, barren, without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 5 mm long, chartaceous, without keels, 5 -veined, pubescent, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 2–4 mm long. Lemma of upper sterile floret oblong, 5 mm long, chartaceous, pubescent, dentate, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 9 mm long. Fertile lemma oblong, 3.5 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex emarginate. Palea oblong, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 3. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent, Indo-China.** Assam, Eastern Himalaya, Nepal.

Yunnan. Sikkim.

Anthoxanthum submuticum (F.v.M.) J.F. Veldkamp. *Blumea*, 30(2): 349 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from Australia. **Basionym or Replaced Name:** *Hierochloe submutica* F. Muell. *Trans. & Proc. Victorian Inst. Advancem. Sci.* 1855: 48 (1855)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Mueller s.n.*, Australia: Victoria: Cobberas Mts (MEL; IT: K).

Recent Synonyms: *Hierochloe submutica* F. Muell., *Trans. Vict. Inst.* 1: 48 (1855).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sub*, almost; *mutica*, blunt.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms erect, 30–60 cm long. Culm-nodes glabrous. Lateral branches lacking. Ligule an eciliate membrane, 4–9 mm long, erose, truncate. Leaf-blades 5–25 cm long, 4–8 mm wide, stiff, aromatic. Leaf-blade surface ribbed (lightly), scaberulous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–18 cm long. Primary panicle branches 2-nate. Panicle branches capillary, pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets or exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 5–6 mm long, 1 length of upper glume, hyaline, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume apex obtuse or acute. Upper glume ovate, 5–6 mm long, 1.1–1.8 length of adjacent fertile lemma, hyaline, 1-keeled, 3-veined. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 5.5 mm long, 1.5 length of fertile lemma, chartaceous, 1-keeled, 5-veined, scaberulous, ciliolate on margins, obtuse, mucicous or mucronate. Fertile lemma ovate, 3.5 mm long, cartilaginous, shiny, without keel, 5-veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute. Palea elliptic, 1-veined, 1-keeled.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male). Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Victoria, Tasmania.

Anthoxanthum tibeticum (F.v.M.) J.F. Veldkamp. *Blumea*, 30(2): 350 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Hierochloe tibetica* Bor, *Kew Bull.* 8(2): 271–272 (1953)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Xizang: Kongbo Province, Pero La, 5000 m, 19 July 1935, *Ludlow, Sherriff & Taylor 5188* (HT: BM).

Recent Synonyms: *Hierochloe tibetica* Bor, *Kew Bull.* 1953, 271 (1953).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ica*, belonging to. From Tibet.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 9–18 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–2.5 mm long, truncate. Leaf-blades flat or involute, 3–5 cm long, 2 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, comprising 10 fertile spikelets. Panicle open, dense, 2.5 cm long, 1 cm wide, bearing few spikelets. Panicle branches pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or cuneate, laterally compressed, truncate, 5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 5 mm long, 1 length of upper glume, membranous, much thinner above, purple, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume elliptic, 5 mm long, 1.2 length of adjacent fertile lemma, membranous, much thinner above, purple, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 4 mm long, 1 length of fertile lemma, membranous, glabrous or pubescent, bearing yellow hairs, lobed, 2 -fid, obtuse. Palea of lower sterile floret pubescent (at apex). Lemma of upper sterile floret oblong, 4 mm long, 1 length of lower sterile floret, membranous, pubescent, lobed, 2 -fid, awned. Awn of upper sterile floret 3 mm long. Fertile lemma elliptic or oblong, 2.5 mm long, cartilaginous, without keel. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex obtuse or acute. Palea 1 -veined, without keels.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male), 1–1.25 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Tibet.

Anthoxanthum tongo (Trin.) Stapf. Dyer, *Fl. Cap.* 7: 466. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from ?South Africa. **Basionym or Replaced Name:** *Ataxia tenuis* Trin., *Mem. Acad. Petersb.* 5: 78 (1840).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (91, Fig. 62).

Derivation (Clifford & Bostock 2007): on account of it having the scent of the tongo bean (*Dipteryx odorata*).

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, mat forming or caespitose. Culms decumbent or rambling, weak, 10–40 cm long. Ligule an eciliate membrane. Leaf-blades filiform, 2–10(–17) cm long, 1–2 mm wide, aromatic.

Inflorescence. Inflorescence a panicle or composed of racemes, comprising 3–30 fertile spikelets. Panicle contracted, linear or oblong, 1–3.5 cm long, bearing few spikelets. Racemes single, lanceolate, paucilateral, 1–2 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume ovate, 4.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume apex acute, mucronate. Upper glume oblong, 5–7 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, dissimilar, barren (or lower male), without significant palea, attached to and deciduous with the fertile. Lemma of lower sterile floret oblong, 4–5 mm long, 2 length of fertile lemma, chartaceous, without keels, 5 -veined, pubescent, lobed, 2 -fid, obtuse, awned. Awn of lower sterile floret dorsal, 2–4 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, pubescent, lobed, 2 -fid, obtuse, awned. Awn of upper sterile floret dorsal, geniculate, 10–13 mm long. Fertile lemma orbicular, 2.5 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma margins convolute, covering most of palea. Lemma apex obtuse. Palea oblong, 1 length of lemma, 1 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2. Stigmas 2, protogynous, pubescent. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Western Cape.

Anthoxanthum utriculatum (R. & P.) Y. Schouten & J.F. Veldkamp. *Blumea* 30(2): 350 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Chile. **Basionym or Replaced Name:** *Torresia utriculata* Ruiz & Pav., *Syst. Veg. Fl. Peruv. Chil.* 1: 251 (1798). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Ruiz & Pavon s.n., 16 Mar 1778–1788, Chile: Prov. Concepción (MA; IT: BAA (fragm. ex BAA)).

Recent Synonyms: *Hierochloe utriculata* (Ruiz & Pav.) Kunth, *Rev. Gram.* 1: 193. t. 8. (1830).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 2 Pooideae (2012) (139), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (*Fl. Pat.* 3: 284, Fig. 186 (1978) as *Hierochloe*).

Derivation (Clifford & Bostock 2007): *L. utriculus*, little belly; *-ata*, possessing. Seed fertile floret enclosed in remains of male florets.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Basal innovations extravaginal. Culms erect, robust, 70–130 cm long, 3–5 -noded. Culm-nodes brown, glabrous. Leaf-sheaths antrorsely scabrous. Ligule an eciliate membrane, obtuse. Leaf-blades 20–50 cm long, 5–14 mm wide. Leaf-blade venation with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface scabrous, rough on both sides, glabrous or pubescent, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle spiciform, linear, interrupted, 9–25 cm long, 1.2–3.3 cm wide. Primary panicle branches appressed. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 5–6 mm long, 0.9 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex obtuse. Upper glume ovate, 5.5–6.5 mm long, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex obtuse.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 5–6 mm long, chartaceous, 1-keeled, 5 -veined, scabrous, ciliolate on midvein, obtuse, awned. Awn of lower sterile floret terminal, 0.5–1.5 mm long. Lemma of upper sterile floret oblong, 1 length of lower sterile floret, chartaceous, scabrous, ciliolate on midvein, obtuse, awned. Awn of upper sterile floret terminal, straight, 0.5–1.5 mm long. Fertile florets female. Fertile lemma ovate, 4 mm long, cartilaginous, without keel, 5 -veined, more than 3-veined. Lemma margins convolute, covering most of palea. Lemma apex acute, muticous or mucronate. Palea linear, 1 -veined, without keels.

Flower and Fruit. Anthers 3, 2.5–4 mm long. Staminodes two present. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina South, Chile South.

Neuquén. Rest of Chile- Biobio, La Auracania, Maule, O'Higgins, Santado, Valpariso. Aisen.

Anthoxanthum wendelboi (Weimarck) J.F. Veldkamp. *Blumea* 30(2): 350 (1985).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Hierochloe*).

TYPE from Afghanistan. **Basionym or Replaced Name:** *Hierochloe wendelboi* G. Weimarck, *Publ. Cairo Univ. Herb.* 7–8: 299 (1977). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy

Database: HT: *Wendelbo & Ekberg W-9669*, 15 Jul 1969, Afghanistan: Laghman, Alishang, 2900–3200 m (GB).

Recent Synonyms: *Hierochloe wendelboi* G. Weimarck, *Publ. Cairo Univ. Herb.*, 78: 299 (1977).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Per Erland Berg Wendelbo (1927–1981) Norwegian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–60 cm long. Ligule an eciliate membrane, 2–4 mm long. Leaf-blades 3–12 cm long, 3.5–9 mm wide, aromatic.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, dense, 3.5–7.5 cm long. Primary panicle branches bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets or exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 3–5.5 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume ovate, 3–5.5 mm long, 1–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 3.5–5 mm long, 1.2–1.3 length of fertile lemma, membranous, 1-keeled, 5 -veined, ciliolate on margins, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret 0.5–2 mm long. Fertile lemma ovate, 3–4 mm long, cartilaginous, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins convolute, covering most of palea, ciliolate. Lemma apex acute, muticous or mucronate. Palea elliptic, 1 -veined, 1-keeled.

Flower and Fruit. Lodicules 2. Anthers 2 (bisexual) or 3 (male). Stigmas plumose. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Pakistan.

Antinoria agrostidea (DC.) Parl. *Fl. Palerm.* 1: 95 (1845).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from France. **Basionym or Replaced Name:** *Poa agrostidea* DC., *Syn. Gall.* 132 (1808). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: France: In littoribus Ligeris [Loire] prope Nannetes [Nantes], *Delaroche s.n.*

Illustrations (Books): F.W.Gould, *The Grasses of Texas* (1975) (as *Aira elegans*), B.Rosengurtt, *Gamineas Uruguayas I* (1970) (as *Aira elegans*).

Derivation (Clifford & Bostock 2007): Gk. *-idea*, resembling. Similar to *Agrostis* in habit or inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Culms geniculately ascending or decumbent, 5–30 cm long, without nodal roots or rooting from lower nodes. Leaf-sheaths smooth. Ligule an eciliate membrane, 3 mm long, lacerate. Leaf-blades 2–12 cm long, 1–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 1–10 cm long, 0.5–7 cm wide. Primary panicle branches branching divaricately. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, glabrous, tip pyriform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite.

Glumes. Glumes persistent, similar, exceeding apex of florets, firmer than fertile lemma, shiny. Lower glume ovate, 1.5–2 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume

primary vein scaberulous. Lower glume apex obtuse. Upper glume ovate, 1.5–2 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.7–0.8 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma apex dentate, 3 -fid, truncate. Palea linear, 1 length of lemma.

Flower and Fruit. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp, obovoid, dorsally compressed, plano-convex.

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 26).

Derivation (Clifford & Bostock 2007): *L. insula*, island; *-are*, pertaining to. Island species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or decumbent, 5–30 cm long. Ligule an eciliate membrane, 1.5–3 mm long. Leaf-blades 2–12 cm long, 1–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 2–10 cm long, 0.5–7 cm wide. Primary panicle branches 1.5–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1.5–3.8 mm long, glabrous, tip pyriform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 1.3–1.6 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite.

Glumes. Glumes persistent, similar, exceeding apex of florets, shiny. Lower glume ovate, 1.3–1.6 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume ovate, 1.3–1.6 mm long, 1.6 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, 0.8–1 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma apex dentate, 3 -fid. Palea linear, 1 length of lemma.

Flower and Fruit. Anthers 3, 0.5–0.7 mm long. Caryopsis with adherent pericarp, obovoid, dorsally compressed, plano-convex.

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southwestern Europe, Southeastern Europe.

Country /Province /State. : Corsica, Sardinia. : Italy, Crete, Sicily. **Northern Africa.** Libya. **Western Asia.** Lebanon-Syria, Palestine, Israel & Jordan, Turkey.

Apera baytopiana M. Dogan. *Notes Roy. Bot. Gard. Edinburgh* 40(1): 79 (1982).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Turkey, Koycegiz to Gokova: *Leblebici, Secmen & Bekat 2857* (EGE holo, ISTE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Asuman Baytop (-) Turkish pharmacist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms erect or geniculately ascending, 16–41 cm long, 3–4 -noded. Culm-internodes smooth, distally glabrous. Leaf-sheaths mostly

shorter than adjacent culm internode, glabrous on surface. Ligule an eciliate membrane, 1.2–3.7 mm long, lacerate, acuminate. Leaf-blades flat or involute, 2.5–7 cm long, 0.7–1.5 mm wide. Leaf-blade surface puberulous, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 2.2–6.2 cm long, 0.5–1.7 cm wide. Primary panicle branches appressed, 0.4–1.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.3–1.1 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.4–2.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, shiny. Lower glume linear, 1.9–2 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn terminal, awn 0.8–1.5 mm long. Upper glume lanceolate, 2.5–2.7 mm long, 1.3–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acuminate, awned, 1 -awned, awn terminal, awn 0.4–0.7 mm long.

Florets. Fertile lemma lanceolate, 1.5–2.1 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface scabrous. Lemma apex acute, awned, 1 -awned. Principal lemma awn subapical, straight, 1–2.3 mm long overall. Palea 1.4–1.6 mm long, 2 -veined.

Flower and Fruit. Anthers 3, 1.4–1.8 mm long. Caryopsis with adherent pericarp.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Turkey.

Apera intermedia Hackel. *Ann. Nat. Hofmus. Wien*, 20: 430 (1905).

Apera spica-venti (L.) Beauv. *Agrost.* 32 (1812).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Basionym or Replaced Name: *Agrostis spica-venti* L., *Sp. Pl.* ed. I. 61 (1753). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Herb. A. Van Royen no. 912.356–53*, (L). LT designated by Cope in Cafferty et al., *Taxon* 49(2): 243 (2000).

Illustrations (Books): C.E.Hubbard, *Grasses* (1968) (290), T. Cope & A. Gray, *Grasses of the British Isles* (111), M.E.Barkworth et al, *Flora of North America north of Mexico Vol 24 Poaceae*, part 1 (2007) (789), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:17(1980)).

Derivation (Clifford & Bostock 2007): *L. spica*, thorn; *venti*, of the wind. Panicle branches long and thin enabling spikelets to wave in the breeze.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 20–100 cm long, 3–5 -noded. Ligule an eciliate membrane, 3–12 mm long. Leaf-blades 7–25 cm long, 3–10 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–25 cm long, 3–15 cm wide. Primary panicle branches spreading, whorled at most nodes, profusely divided, 3–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–3 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, exceeding apex of florets, shiny. Lower glume lanceolate, 2.2–2.5 mm long, 0.75–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.5–3 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 2.1–2.8 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above. Lemma apex acute, awned, 1 -awned. Principal lemma awn subapical, flexuous, 5–10 mm long overall. Palea 0.9–1 length of lemma, 2 -veined.

Flower and Fruit. Anthers 3, 1–2 mm long. Caryopsis with adherent pericarp, ellipsoid. Endosperm liquid.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. tres*, three; *arista*, bristle; *-ata*, possessing. Spikelets with lower glume two-awned and upper glume one-awned.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms erect, 15–23 cm long, 3-noded. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 4–5 mm long, lacerate. Leaf-blades 4.5–8 cm long, 1.5–2.5 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, dense, 2–10 cm long, 0.8–2.5 cm wide. Primary panicle branches ascending, 1–2.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.3–0.8 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 2.6–2.9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, exceeding apex of florets, shiny. Lower glume lanceolate, 1.9–2.1 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn terminal, awn 2.2–2.9 mm long. Upper glume lanceolate, 2.4–2.6 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acuminate, awned, 1 -awned, awn terminal, awn 1.5–1.7 mm long.

Florets. Fertile lemma lanceolate, 2–2.4 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface granulose, rough above. Lemma apex acute, awned, 1 -awned. Principal lemma awn subapical, straight or curved, 6.5–10 mm long overall. Palea 2 mm long, 2 -veined.

Flower and Fruit. Anthers 3, 1.5–1.7 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Western Asia. Turkey.

Aphanelytrum peruvianum Sanchez Vega, P.M.Peterson, Soreng & Laegard. *Journ. Bot. Instit. Texas* 1: 842 (2007).

TYPE from Peru. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: prov. Cajamarca, Dist. Cajamarca, Cerro Akumulca, al SO de Cajamarca sobre la cima de la ladera occidental del Valle de Cajamarca, 7.14.15S 78.29.24S, 3300 m, 20 Mar 2003, I. Sánchez Vega 11718 (HT: CPUN; IT: AAU, F, HAO, HUT, LOJA, MICH, MO, S, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. From Peru.

Classification. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal. Culms geniculately ascending, 14–24 cm long. Culm-internodes 0.3–1.3 cm long. Leaf-sheaths longer than adjacent culm internode, keeled. Ligule an eciliate membrane, 2–3 mm long, erose or lacerate. Leaf-blades flat or involute, 3–7 cm long, 0.2–1.2 mm wide, 1.6 cm long at summit of culm. Leaf-blade apex hooded.

Inflorescence. Inflorescence a panicle, comprising 5–10 fertile spikelets. Panicle open, linear, 1.7–2.5 cm long. Primary panicle branches appressed, simple, bearing 2 fertile spikelets on each lower branch. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or cuneate, laterally compressed, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.2–2 mm long.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume linear, 1–2 mm long, 1 length of upper glume, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 1–2 mm long, 0.25–0.33 length of adjacent fertile lemma, 3(–4) -veined. Upper glume apex entire or dentate, 2 -fid, acute.

Florets. Fertile lemma lanceolate, 2.2–3.5 mm long, herbaceous, keeled, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma apex dentate, 3 -fid, with lobes 0.1–0.3 mm long. Palea 2–3.2 mm long. Palea keels scabrous. Palea apex dentate, 2 -fid.

Flower and Fruit. Lodicules 2, lanceolate, 0.7–0.8 mm long. Anthers 3, 2–2.9 mm long, yellow. Ovary glabrous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

Aphanelytrum procumbens (Hack.) Hack. *Oesterr Bot. Zeitschr.* 1902, 13. (1902).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Brachyelytrum procumbens* Hack., Engl. & Prantl, *Pflanzenf* 2(2):. Nachtr 42 (1897). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Sodi*, *s.n.*, Ecuador: Prov. unknown: 2000 m [En los bosques subandinos Canzacoto, ?2000 metros sobre el nivel del mar. Raro] (W; IT: US-865406 (fragm. ex W)). [see Hackel, *Oesterr. Bot. Z.* 52: 12 (1902)].

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (124, Fig. 30), E.G.Nicora, *Los Generos de Gramineas de America Austral* (1987) (278, Fig. 89).

Derivation (Clifford & Bostock 2007): *L. procumbo*, fall down. Culms creeping.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, mat forming. Culms prostrate, 30–50 cm long (long), rooting from lower nodes. Ligule an eciliate membrane, 2 mm long. Leaf-blades 3–10 cm long, 2–3 mm wide, flaccid.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, 6–22 cm long. Primary panicle branches whorled at most nodes, simple, bearing 2–3 fertile spikelets on each lower branch. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–2 mm long, eventually visible between lemmas.

Glumes. Glumes both absent or obscure (rarely to 1mm long).

Florets. Fertile lemma lanceolate, 4–9 mm long, herbaceous, keeled, 5 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex setaceously acuminate. Palea keels eciliate.

Flower and Fruit. Anthers 3, 4 mm long. Ovary glabrous. Caryopsis with adherent pericarp. Hilum elliptic.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia, Colombia, Ecuador.

Derivation (Clifford & Bostock 2007): *L. blunt*. Lacking awns or lemmas and/or glumes truncate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Ischaeminae.

Habit, Vegetative Morphology. Perennial. Culms scandent or decumbent or prostrate, 30–300 cm long, rooting from lower nodes. Ligule a ciliolate membrane. Leaf-blade base tapering to the midrib. Leaf-blades 5–25 cm long, 2–10 mm wide. Leaf-blade apex attenuate, filiform.

Inflorescence. Synflorescence compound, paniculate, 3–40 cm long, lax.

Inflorescence composed of racemes, terminal and axillary, subtended by a spatheole, enclosed. Spatheole ovate, 3.5–10 cm long, membranous. Racemes 1, single, bearing a triad of spikelets. Rhachis obsolete. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, oblong, flattened, subequal, 2–4 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets rudimentary or well-developed (pair unequal), male, lanceolate, dorsally compressed, 2–5 mm long, as long as fertile, separately deciduous. Companion sterile spikelet glumes herbaceous, acute, mucous. Companion sterile spikelet lemmas 2, enclosed by glumes, mucous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 2–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus oblong (bulbous), 0.5–2.5 mm long, base obtuse.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, much thinner above, without keels, keel-less except near apex, winged on keel, winged narrowly, 13 -veined. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, gibbous, chartaceous, 1-keeled, 5–9 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 0.9 length of spikelet, hyaline, 3 -veined, acute. Fertile lemma oblong, 4 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma apex entire or lobed, 2 -fid, incised 0.6 of lemma length, mucous or awned, 1 -awned. Principal lemma awn from a sinus, straight or geniculate, 4–12 mm long overall, without a column or with twisted column. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. $n = 10$ (5 refs TROPICOS), or 30 (2 ref TROPICOS). $2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia, Australasia, Pacific, North America (*), South America.

Country /Province /State. **Northeast Tropical Africa.** Socotra. **Middle Asia, Western Asia, Arabian Peninsula, China, Eastern Asia.** Turkmenistan, Uzbekistan. Afghanistan, Iraq. Oman. Apochiton burttii C. E. Hubbard. *Hook. Ic. Pl.* 34: t. 3319 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Kondoa Irangi District near Sambala: *B.D.Burt 2602* (K holo; iso BM, US 1646885).

Illustrations (Books): R.M.Pohill, F.T.E.A., *Gramineae* (2(1974) :187, Fig. 59).

Illustrations (Journals): *Hooker's Icones Plantarum* (3319 (1936)).

Derivation (Clifford & Bostock 2007): in honor of Burt who collected in Tanzania.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending or decumbent, 20–90 cm long, rooting from lower nodes. Leaves mostly basal. Ligule an eciliate membrane, 0.5 mm long, erose, truncate. Leaf-blades 4–30 cm long, 1.5–4 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, 3–20 cm long, contracted about primary branches. Primary panicle branches bearing spikelets almost to the base. Spikelets ascending, solitary. Fertile spikelets pedicelled. Pedicels present, filiform or linear, 1–2 mm long.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent.

Glumes. Glumes persistent, similar, subequal in width, shorter than spikelet. Lower glume lanceolate, 4.5–5 mm long, 0.8–0.9 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate, mucronate or awned, 1 -awned, awn 0.2–2.5 mm long. Upper glume lanceolate, 5–6.5 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acuminate, mucronate or awned, 1 -awned, awn 0.2–2.5 mm long.

Florets. Fertile lemma ovate, 4–5.5 mm long, membranous, keeled, 3 -veined, 0–3 -veined. Lemma surface pubescent, hairy below. Lemma apex acute, awned, 1 -awned. Principal lemma awn 2–3 mm long overall. Palea 0.5–0.7 length of lemma, 2 -veined. Palea keels ciliate, adorned below, with 0.5–0.7 of their length adorned. Palea apex dentate, 2 -fid, acuminate, awned, awns 2–3.5 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, entire, emarginate. Anthers 3, linear. Stigmas 2. Caryopsis with free soft pericarp, ellipsoid, isodiametric, trigonous. Embryo 0.3–0.4 length of caryopsis. Endosperm farinose. Disseminule comprising a floret.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa. Tanzania.

Apochloa animara (S.A. Renvoize) Zuloaga & Morrone. *Systematic Botany* 33: 290 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum animarum* S.A. Renvoize, *Kew Bull.*, 32(2): 423 (1978). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.M. Harley et al. 15411*, 22 Jan 1974, Brazil: Bahia: Rio de Contas, Pico de Almas, ca. 25 km WNW of town of Rio de Contas, 1500 m (K; IT: CEPEC, R, US-2967813).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (144, Fig.60 as *Panicum*).

Derivation (Clifford & Bostock 2007): from the Sierra de las Animas, Uruguay.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 80–110 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths glabrous on surface or pubescent, outer margin hairy. Ligule a ciliate membrane. Leaf-blades linear or lanceolate, 14–40 cm long, 7–11 mm wide, stiff. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, 12–15 cm long. Primary panicle branches profusely divided. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, 2–2.5 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, purple, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, purple, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 2–2.5 mm long, indurate, pallid, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Bahia. Bahia.

Apochloa bahiense (Renvoize) Zuloaga & Morrone. *Systematic Botany* 33: 290 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum bahiense* Renvoize, *Kew Bull.*, 32(2): 423 (1978). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: R.M. Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (144, Fig. 60 as *Panicum*).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Bahia Province, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths hirsute. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades lanceolate, 18–40 cm long, 8–12 mm wide, stiff. Leaf-blade surface pubescent. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 15–30 cm long, 6–12 cm wide. Primary panicle branches ascending, profusely divided. Panicle branches with scattered hairs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse, 1.5 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.66 length of spikelet, membranous, pallid, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, pallid, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, purple, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 1.5 mm long, indurate, pallid, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.
Bahia. Bahia.

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004).

Derivation (Clifford & Bostock 2007): Gk. *chnoos*, fine down on a peach; *-odes*, resembling. Leaf-blades densely hairy.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 50–105 cm long. Leaves without demarcation between sheath and blade. Ligule absent. Leaf-blades 20–40 cm long, 5–10 mm wide. Leaf-blade surface glabrous or pubescent. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 10–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 2–2.5 mm long, falling entire.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex obtuse or acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma ovate, dorsally compressed, 1.5–2 mm long, indurate, pallid, shiny, without keel, more than 3-veined. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.25 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. Guyana, Venezuela. Brazil Southeast, Brazil North.

Minas Gerais.

Apochloa cipoense (Renvoize & T. Sendulsky) Zuloaga & Morrone. *Systematic Botany* 33: 291 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum cipoense* Renvoize & T. Sendulsky, *Kew Bull.*, 35(1): 229 (1980). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Minas Gerais: Serra do Cip? 9 Dec 1971, *Sendulsky et al.* 419 (HT: SP; IT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Serra do Cipos, Minas Gerais, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect, 32–60 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths glabrous on surface or pilose, outer margin hairy. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades flat or involute, 13–20 cm long, 2–3 mm wide, stiff. Leaf-blade surface pilose, densely hairy. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, dense, 6–11 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, flexuous, 3–12 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, 2–3 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.66 length of spikelet, membranous, without keels, 3 -veined. Lower glume surface pilose. Lower glume apex acuminate. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5–7 -veined. Upper glume surface pilose. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5–7 -veined, pilose, acute. Palea of lower sterile floret pilose. Fertile lemma elliptic, dorsally compressed, 2–3 mm long, indurate, pallid, without keel. Lemma margins involute. Palea involute, indurate. Palea surface pilose.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais.

Apochloa eligulata (N. E. Br.) Zuloaga & Morrone. *Systematic Botany* 33: 291 (2008).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Venezuela. **Basionym or Replaced Name:** *Panicum eligulatum* N. E. Br., *Trans. Linn. Soc. Ser. II.* 6: 74 (1901). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *McConnell & Quelch 675*, Venezuela: Mt. Roraima (K; IT: K, US-1039479 (fragm. ex K & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *e-*, without; *ligula*, small tongue; *-ata*, possessing. Ligule lacking or very much reduced.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rootstock evident. Butt sheaths persistent and investing base of culm, with curly dead sheaths. Culms 50–75 cm long, with prop roots. Leaves mostly basal. Leaf-sheaths hirsute. Ligule absent. Leaf-blades flat or involute, 20–30 cm long, 7–13 mm wide, stiff. Leaf-blade surface scabrous, glabrous or hirsute. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Peduncle 10–15 cm long, glabrous. Panicle open, ovate or pyramidal, 10–15 cm long. Primary panicle branches ascending, not whorled or whorled at lower nodes. Panicle branches glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2.7–3.3 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 1–1.5 mm long, 0.33–0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex obtuse or acute. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 5–7 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma ovate, dorsally compressed, 1.5–2 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex acuminate. Palea involute, indurate.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Guyana, Venezuela.

Minas Gerais, Rio de Janeiro, Espirito Santo.

Apochloa euprepes S.A. Renvoize. *Systematic Botany* 33: 292 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum euprepes* S.A. Renvoize, *Kew Bull.*, 32(2): 422 (1978). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.F.M. Glaziou 17952*, 22 Nov 1888, Brazil: Minas Gerais: Serra d'Ouro Branco: prope S. Juliao (K; IT: US-1126937 (fragm. ex B), US-1280072).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (144, Fig. 60 as *Panicum*).

Derivation (Clifford & Bostock 2007): Gk. *eu-*, well; *prepo*, catch the eye; In contrast to *Andropogon* lacks pedicellate sterile spikelets.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms 60–65 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths glabrous on surface or hirsute, outer margin hairy. Ligule a ciliate membrane. Leaf-blades involute, 12–40 cm long, 3–7 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or obovate, 9–15 cm long. Primary panicle branches ascending, moderately divided. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, 2 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 2 mm long, indurate, pallid, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil Southeast.

Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo. Bahia. Minas Gerais.

Apochloa jauana (G. Davidse) Zuloaga & Morrone. *Systematic Botany* 33: 292 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Venezuela. **Basionym or Replaced Name:** *Panicum jauanum* G. Davidse, *Bol. Soc. Venezol. Cienc. Nat.*, 32 (132–133): 272 (1976). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: J. A. Steyermark, V. Carreño Espinoza & C. Brewer-Carias 109486, 22–28 Feb 1974, Venezuela: Bolívar: Meseta de Jaua, Cerro Jaua, cumbre, 4°8'50"N, 64°4'10"W, porción sur-este, selva de galería al borde del tributario del Río Marajano (MO-2192007).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (202, Fig. 155 as *Panicum jauanum*).

Derivation (Clifford & Bostock 2007): L. *-anum*, indicating connection. From Jaua Plateau, Bolivar State, Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 100–150 cm long. Leaf-sheaths pilose. Ligule a ciliate membrane, 0.3–2.3 mm long. Leaf-blades 20–40 cm long, 12–16 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 15 cm long, 9 cm wide. Primary panicle branches 5–11 cm long. Panicle branches glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 3.1–3.3 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 2.1–2.3 mm long, 0.66 length of spikelet, membranous, without keels, 3 -veined. Lower glume primary vein scabrous. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume primary vein scabrous.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined. Fertile lemma elliptic, dorsally compressed, 2.6–2.7 mm long, indurate, yellow, without keel. Lemma surface smooth. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.7 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Apochloa lorea (Trin.) Zuloaga & Morrone. *Systematic Botany* 33: 292 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum loreum* Trin., *Gram. Panic.* 211. (1826). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: G.H. von Langsdorff, Nov. 24, Brazil: Minas Gerais: S. da Lapa, in glareosis humidis (LE-TRIN-0799.01 (& fig.); IT: K, NY, US-974669 (fragm. ex LE)).

Illustrations (Journals): *Systematic Botany* (33: 292, fig.4 (2008)).

Derivation (Clifford & Bostock 2007): L. made of leather thongs. Leaf-blades coriaceous.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms erect, 100–200 cm long. Leaves without demarcation between sheath and blade. Ligule absent. Leaf-blades 30–

60 cm long, 5–12 mm wide, glaucous. Leaf-blade surface scabrous, glabrous, hairless except near base. Leaf-blade margins glabrous or ciliate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate or pyramidal, 16–22 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 1.5–2 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.33–0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 3–5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 1.5–2 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais.

Apochloa lutzii (Swallen) Zuloaga & Morrone. *Systematic Botany* 33: 292 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum lutzii* Swallen, *Mem. Inst. Oswaldo Cruz*, 63. 301 (1965). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A. Lutz* 687, Feb 1914, Brazil: Rio de Janeiro: Tijuca (US-2240718).

Illustrations (Journals): *Systematic Botany* (33: 293, fig.5(2008)).

Derivation (Clifford & Bostock 2007): in honor of Adolpho Lutz (fl. 1914) who collected in Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–50 cm long. Leaves mostly basal. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane. Leaf-blades flexuous, conduplicate, 15–30 cm long, 2–5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 8–10 cm long, 1 cm wide. Primary panicle branches appressed, 2–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 1.8–2 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.66 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 3–5 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 3–5 -veined, obtuse. Fertile lemma elliptic, dorsally compressed, 1.6 mm long, indurate, light brown, without keel. Lemma margins involute. Lemma apex acute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Rio de Janeiro.

Apochloa molinioides (Trin.) Zuloaga & Morrone. *Systematic Botany* 33: 293 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum molinioides* Trin., *Gram. Panic.* 238 (1826). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: 954, Nov 24, Brazil:

Serra da Lapa (LE). no.381 Trin. scrips.. HT: *G.H. von Langsdorff s.n.*, Nov 1824, Brazil: Minas Gerais: in glareosis humidiusculis S. da Lapa (LE-TRIN-0842.01; IT: K, US-974507 (fragm. ex LE)).

Illustrations (Journals): *Systematic Botany* (33: 293, fig.6 (2008)).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Molinia*.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 50–100 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths glabrous on surface or pubescent. Ligule absent. Leaf-blades lanceolate, 20–30 cm long, 8–15 mm wide. Leaf-blade surface glabrous or pubescent.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–30 cm long. Primary panicle branches spreading. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, 1.5–1.75 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, clasping, 0.5–0.66 length of spikelet, membranous, pallid or yellow, without keels, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, purple, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, purple, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 1.5 mm long, indurate, pallid, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais.

Apochloa poliophylla (S.A. Renvoize & F. Zuloaga) Zuloaga & Morrone. *Systematic Botany* 33: 293 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum poliophyllum* S.A. Renvoize & F. Zuloaga, *Kew Bull.*, 39(1): 193 (1984). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.S. Irwin, H. Maxwell & D.C. Wasshausen 19908*, 12 Feb 1968, Brazil: Minas Gerais: Serra do Espinhaço, Serra do Itabirito, ca. 45 km SE of Belo Horizonte, elev. ca. 1600 m, culms erect, to ca. 1.5 m tall, in thicket island in campo, upland campo and adjacent rocky slopes and outcrops (NY; IT: F, GH, MO-2046550, UB).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *polios*, gray; *phyllon*, leaf. Leaf-blades glaucous or grey-green.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 90–135 cm long. Leaf-sheaths keeled, pilose, outer margin hairy. Ligule a ciliate membrane. Leaf-blades linear or lanceolate, conduplicate or involute, 35–72 cm long, 6–12 mm wide, stiff, glaucous or grey-green. Leaf-blade surface glabrous or pilose. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or pyramidal, 20–26 cm long, 7–18 cm wide. Primary panicle branches ascending or spreading, whorled at most nodes, profusely divided. Panicle branches pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2–2.5 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–0.75 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 2–2.5 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais.

Apochloa sipapoense (Swallen) Zuloaga & Morrone. *Systematic Botany* 33: 293 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Venezuela. **Basionym or Replaced Name:** *Panicum sipapoense* Swallen, *Mem. N. Y. Bot. Gard.* 9: 261 (1957). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Maguire, L. Politi 28364*, 14 Jan 1949, Venezuela: Amazonas: infrequent, rocks, Caño Profundo, Cerro Sipapo (US-2040188; IT: NY).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Sipapo, Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations flabellate. Culms erect, 60–80 cm long. Leaves without demarcation between sheath and blade. Leaf-sheaths without keel, hirsute. Ligule a ciliate membrane, 0.2–0.6 mm long. Leaf-blades flat or involute, 10–30 cm long, 2–6 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 9–13 cm long, 10–14 cm wide. Primary panicle branches spreading. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2.7–2.8 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex obtuse. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, obtuse. Palea of lower sterile floret pubescent, adorned on keels. Fertile lemma elliptic, dorsally compressed, 2.2–2.4 mm long, indurate, yellow, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Apochloa steyermarkii (Swallen) Zuloaga & Morrone. *Systematic Botany* 33:294 (2009).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Venezuela. **Basionym or Replaced Name:** *Panicum steyermarkii* Swallen, *Mem. N. Y. Bot. Gard* 9: 402 (1957). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.A. Steyermark, J.J. Wurdack 954*, 20 Feb 1955, Venezuela: Bolívar: Chimanta Massif, Torono-tepu? Caño Mojado, E of N escarpment, below upper falls of Caño Mojado, frequent along banks of Caño Mojado, 1895–1910 m (US-2182133; IT: F, NY).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (205, Fig. 159).

Illustrations (Journals): *Systematic Botany* (33: 294, fig.7 (2008)).

Derivation (Clifford & Bostock 2007): in honor of Julian Alfred Steyermark (1909–1988) United States botanist who worked principally in Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms geniculately ascending, 40–85 cm long, wiry. Leaves mostly basal. Leaf-sheaths loose, glabrous on surface. Leaf-sheath auricles erect. Ligule a fringe of hairs or absent, 0–1 mm long. Leaf-blades erect, flat or involute, 20–25 cm long, 5–6 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex attenuate, pungent.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–9 cm long. Primary panicle branches ascending, 2–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acute or acuminate, 3.5–4 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, acute. Fertile lemma elliptic, dorsally compressed, 3 mm long, indurate, without keel. Lemma margins involute. Lemma apex acuminate. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Apochloa subtiramulosa (S.A. Renvoize & F. Zuloaga) Zuloaga & Morrone. *Systematic Botany* 33: 294 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum subtiramulosum* S.A. Renvoize & F. Zuloaga, *Kew Bull.*, 39(1): 187 (1984). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.S. Irwin, R. Souza & R. Reis dos Santos 8682*, 26 Sep 1965, Brazil: Distrito Federal: Córrego Gama, between Gama and Brasília, near road to Anápolis, elev. 1175 m, caespitose, the culms to 60 cm tall, inflorescence cream, creek margin, creek valley (NY; IT: MO, UB, US-2528701, US-2369457).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. subtilis*, delicate; *ramus*, branch; *-ula*, diminutive; *-osum*, abundance. Inflorescence branches are delicate and thread-like.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 6–70 cm long. Ligule a ciliate membrane. Leaf-blades aciculate, terete, 40–50 cm long, 1–1.5 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 11 cm long, 5–7.5 cm wide. Primary panicle branches spreading, whorled at most nodes. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, 4 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.33–0.5 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute, mucronate. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, ciliate on margins, acute. Fertile lemma elliptic, dorsally compressed, 4 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central. Goias. Distrito Federal.

Apochloa tijucae (S.A. Renvoize) Zuloaga & Morrone. *Systematic Botany* 33: 294 (2008).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Panicum*).

TYPE from Brazil. **Basionym or Replaced Name:** *Panicum tijucae* S.A. Renvoize, *Kew Bull.*, 32(2): 422 (1978). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.F.M. Glaziou* 6967, 3 Jun 1874, Brazil: Rio de Janeiro: Pico de Tijuca (K; IT: US-1280019, US-1126940).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. from Pico de Tijuca, near Rio de Janeiro, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Butt sheaths pubescent. Basal innovations flabellate. Culms erect, 50 cm long. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane. Leaf-blades lanceolate, 30–40 cm long, 5–8 mm wide, stiff, glaucous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 6–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, 3 mm long, falling entire.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.5–1 length of spikelet, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, membranous, 5 -veined, acute. Fertile lemma elliptic, dorsally compressed, 2.5 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Rio de Janeiro.

Apoclada diversa McClure & L. B. Smith. *Fl. Illustr. Catar.*, Pt. 1, *Gramin.*, *Supl. Bambus.* 59 (1967).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.R. Swallen* 8271, 22 Jan 1946, Brazil: Santa Catarina: Cagador, rio Cacador, lugares zmidos (US-2383418; IT: US-2152479).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (123, Fig. 26).

Illustrations (Journals): *Smithsonian Contributions to Botany* (9: 14, Fig. 4 (1973)).

Derivation (Clifford & Bostock 2007): L. variable. Stamen number variable.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 500–800 cm long, woody. Culm-internodes terete, thick-walled, glaucous, distally pubescent. Lateral branches dendroid. Branch complement several, in a horizontal line, with 3 branches dominant, thinner than stem. Culm-sheaths present, deciduous. Leaves cauline. Ligule an eciliate membrane.

Inflorescence. Synflorescence simple.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, exserted. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 10–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes curved, 4 mm long, scaberulous.

Glumes. Glumes both absent or obscure.

Florets. Fertile florets decreasing in size upwards. Fertile lemma lanceolate, 5–15 mm long, chartaceous, yellow, keeled, more than 3-veined. Lemma surface scaberulous. Lemma apex attenuate.

Palea lanceolate. Palea keels ciliolate. Palea surface scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, membranous, veined. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.

Catarina, Rio Grande do Sul. Santa Catarina.

Apoclada simplex McClure & L. B. Smith. *Fl. Illustr. Catar.*, Pt. 1, *Gramin.*, *Supl. Bambus.* 59 (1967).

Derivation (Clifford & Bostock 2007): L. simple. Culms or inflorescences unbranched.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 500–800 cm long, 25–50 mm diam., woody. Culm-internodes terete, thick-walled, distally pubescent. Culm-nodes glabrous. Lateral branches dendroid. Branch complement several, in a horizontal line, with 3 branches dominant, thinner than stem. Culm-sheaths present, persistent, antrorsely scabrous, without auricles, ciliate on shoulders. Culm-sheath ligule 0.5–1 mm high. Culm-sheath blade triangular, erect, glabrous on surface, acuminate. Leaves cauline. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs setose, erect. Ligule an eciliate membrane, 0.2–0.5 mm long, erose, truncate. Collar with external ligule. Leaf-blades linear, convolute, 5–8 cm long, 1–2 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Synflorescence simple.

Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, subtended by an unspecialized leaf-sheath, embraced at base by subtending leaf. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 8–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 20–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent.

Glumes. Glumes both absent or obscure.

Florets. Fertile lemma ovate, 18–22 mm long, chartaceous, keeled, 9–11 -veined, more than 3-veined. Lemma surface puberulous, hairy on veins. Lemma apex acuminate. Palea lanceolate, 0.8 length of lemma. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ovate, membranous, veined. Anthers 3(–5). Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.

Sao Paulo Parana, Catarina, Rio Grande do Sul. Paraná, Santa Catarina.

Apocopis anomalus Bor. *Kew Bull.* 1957, 415 (1958).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Burma. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mindat, 5,000 ft, a small grass coming up in the burnt and blackened pine forest along the Mindat ridge, 26 Apr 1956, *F. Kingdon-Ward 22155* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *anomalos*, irregular. Diverging from the normal, often with respect to number of lemmas in the spikelet or otherwise unusual for the genus in some respect.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths glabrous. Culms 10–20 cm long, 2 -noded. Culm-nodes constricted, glabrous. Leaf-sheaths pilose, with tubercle-based hairs. Ligule an eciliate membrane, 1 mm long. Leaf-blades linear or lanceolate, flat or involute or revolute, 4–8 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough adaxially, pilose, sparsely hairy, hairy abaxially, with tubercle-based hairs. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 1.5–2.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs white. Rhachis internodes linear, 2.5–3 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 3–4 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, elliptic, dorsally compressed, 3 mm long, longer than fertile. Companion sterile spikelet glumes chartaceous, 3–5 -veined, pilose, truncate, muticous. Companion sterile spikelet lemmas 2, enclosed by glumes, 1-awned (geniculately), with 5 mm long awn.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong, 4.5 mm long, 0.9 length of spikelet, chartaceous, much thinner above, without keels, 5 -veined. Lower glume lateral veins distinct. Lower glume surface pilose, hairy below. Lower glume hairs white. Lower glume apex erose, truncate. Upper glume oblong, 1 length of spikelet, chartaceous, with hyaline margins, 3 -veined. Upper glume surface pilose. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 4.5 mm long, 0.9 length of spikelet, hyaline, 0 -veined, without midvein, without lateral veins, pilose, hairy at apex, truncate. Fertile lemma oblong, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 8 mm long overall, with twisted column. Column of lemma awn hispidulous. Palea hyaline, 2 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 1–2 mm long.

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Apocpis breviglumis Keng & S.L. Chen. *Acta Phytotax. Sin.* 13(1): 59–60, pl. 3. 1975.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 837).

Derivation (Clifford & Bostock 2007): L. *brevis*, short; *gluma*, husk. One or both glumes short with respect to the length of the spikelet.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms 25–50 cm long, wiry, 7–9 -noded. Leaf-sheaths pilose. Ligule an eciliate membrane, 1 mm long. Leaf-blades linear or lanceolate, 3–13 cm long, 2.5–6 mm wide. Leaf-blade surface pilose, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, 2.5–4.5 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny. Rhachis internodes linear, 2 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear.

Sterile Spikelets. Basal sterile spikelets well-developed, 1 in number. Basal sterile spikelet lemmas awnless.

Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate or cuneate, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, attached transversely. Spikelet callus hairs tawny.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume obovate or cuneate, 0.9 length of spikelet, chartaceous, much thinner above (and red-brown), yellow, without keels. Lower glume primary vein falling short of apex. Lower glume lateral veins transversely connected at apex, all falling short of apex. Lower glume surface pilose, hairy at apex. Lower glume apex erose, truncate. Upper glume oblong, 1 length of spikelet, chartaceous.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret lanceolate, hyaline, pilose, hairy at apex, erose. Fertile lemma lanceolate or oblong, chartaceous, without keel. Lemma apex entire, awned, 1 -awned. Principal lemma awn geniculate, 22–28 mm long overall, with twisted column.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan, Yunnan.

Apocopsis burmanicus Narayan. ex Bor. *Kew Bull.* 1951, 169 (1951).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Burma. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Burma: Rangoon Lake, December 1876, ..., S. Kurz 2749 (HT:K) see notes.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Burma, now Myanmar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms rambling, 10–20 cm long. Culm-nodes glabrous. Leaf-sheaths keeled, pilose, with tubercle-based hairs. Ligule an eciliate membrane, 0.75 mm long, lacerate. Leaf-blades 2–3.5 cm long, 2–4 mm wide, flaccid. Leaf-blade midrib keeled beneath. Leaf-blade surface scaberulous, pubescent, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scaberulous, tuberculate-ciliate. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 2, paired, 2–3 cm long. Rhachis fragile at the nodes, subterete, puberulous on surface, ciliate on margins. Rhachis hairs tawny. Rhachis internodes linear, 1.25 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 1.25 mm long, ciliate, with tawny hairs, with 2.5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma, shiny. Lower glume oblong, 0.9 length of spikelet, coriaceous, much thinner above, much thinner on margins, dark brown, without keels, 7 -veined. Lower glume primary vein extending to apex. Lower glume lateral veins obscure, with some extending to apex. Lower glume surface glabrous or pilose, hairy below. Lower glume apex erose, truncate. Upper glume oblong, 1 length of spikelet, chartaceous, yellow or light brown, 3 -veined. Upper glume lateral veins all falling short of apex. Upper glume apex erose, truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret elliptic or oblong, 3 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire or dentate, 2 -fid, awned, 1 -awned. Principal lemma awn apical or from a sinus, geniculate, 18 mm long overall, with twisted column. Column of lemma awn 9 mm long, hispidulous. Palea 2 mm long, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–2.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Apocopis cochinchinensis A. Camus. *Bull. Mus. Hist. Nat. Paris*, 25: 286. (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cochinchina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *J.B.L. Pierre s.n.*, no date, Vietnam (US-1062404).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Cochinchina, now included in Laos and Cambodia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms erect, slender, 20–40 cm long. Leaf-sheaths keeled, pilose, with tubercle-based hairs. Ligule an eciliate membrane, 0.5–1 mm long, lacerate. Leaf-blades 2–4 cm long, 2–4 mm wide. Leaf-blade midrib keeled beneath. Leaf-blade surface glabrous or pilose, hairy abaxially, with tubercle-based hairs. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 2, paired, 1–2 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs yellow, 1.75 mm long. Rhachis internodes linear, 1.75 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 1.75 mm long, ciliate, with 2–2.5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 4.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume lanceolate or elliptic, 0.66 length of spikelet, coriaceous, much thinner above, much thinner on margins, yellow, without keels, 7 -veined. Lower glume primary vein extending to apex or falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume apex erose, emarginate. Upper glume oblong, 1 length of spikelet, chartaceous, yellow, 3 -veined. Upper glume lateral veins all falling short of apex. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret lanceolate or oblong, 3.5 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma oblong, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 20 mm long overall, with twisted column. Column of lemma awn 10 mm long, hispidulous. Palea 4 mm long, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–2.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar, Thailand, Vietnam.

Apocopis collinis Balansa. Morot, *Journ. de Bot.* 4: 84. (1890).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)* (as *A. collinus*).

TYPE from Cochinchina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mt. Pursat: *Godefroy 389*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. collis*, a hill; -ina, belonging to. Mountain species.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Culms 20–40 cm long, 3–4 -noded. Culm-nodes brown or purple. Leaf-sheaths glabrous on surface or pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 1 mm long. Leaf-blades 3–5 cm long, 2–3.5 mm wide. Leaf-blade surface smooth, pubescent, hairy

abaxially, with tubercle-based hairs. Leaf-blade margins cartilaginous, smooth or scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 1–2, single or paired, 2–4.5 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny, 3 mm long. Rhachis internodes linear, 2 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 0.5–1.5 mm long, ciliate, with tawny hairs, with 4 mm long hairs.

Sterile Spikelets. Basal sterile spikelets well-developed, 1 in number.

Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5.5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 5.5–6 mm long, 1 length of spikelet, coriaceous, much thinner above, much thinner on margins, light brown, without keels, 7 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume surface asperulous (granular). Lower glume margins ciliate. Lower glume apex truncate or obtuse. Upper glume lanceolate, 1 length of spikelet, chartaceous, 3 -veined. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret lanceolate or ovate, 5 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma oblong, 4.5 mm long, hyaline, without keel, 0–1 -veined, 0–3 -veined, without veins or one-veined. Lemma apex erose, mucicous or mucronate. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–3 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China, Malesia. Thailand, Vietnam. Borneo, Sulawesi.

Apocopis courtallumensis (Steud.) Henrard. *Blumea*, 4: 524, (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Andropogon courtallumensis* Steud., *Syn. Pl. Gram.* 377 (1854). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: [IGS: type loc.: "Cortallum Ind. or."].

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (783, Pl 783).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Courtallum, Madras State, India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms erect, 25–50 cm long. Leaf-sheaths striately veined, pilose, with tubercle-based hairs. Ligule an eciliate membrane, 1.5–2 mm long. Leaf-blades linear or lanceolate, 1–10 cm long, 3–6 mm wide. Leaf-blade midrib keeled beneath. Leaf-blade surface scabrous, pilose, densely hairy, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 2, paired, 2–4 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny, 1–2 mm long. Rhachis internodes linear, 2 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 2.5 mm long, ciliate, with tawny hairs, with 2 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume obovate, 4.5–5 mm long, 0.9–1 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex or with some

extending to apex. Lower glume apex emarginate. Upper glume oblong, 1 length of spikelet, chartaceous, light brown, 3 -veined. Upper glume surface pubescent. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret lanceolate, 4.75 mm long, hyaline, 0 -veined, without midvein, without lateral veins, erose. Fertile lemma lanceolate or oblong, 4.5 mm long, chartaceous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 18–20 mm long overall, with twisted column. Column of lemma awn 8 mm long, pubescent. Palea tightly convolute around flower, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2.5–3.5 mm long.

$n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. India. Laos, Thailand. Tamilnadu.

Apocopus floccosus Bor. Kew Bull. 414 (1958).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Burma. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Burma: Taunggyi, fairly common on hillsides, 19 Jun 1948, *U Thein Lwin 531* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. floccus*, lock of wool; *-osus*, abundance. Basal leaf-sheaths densely hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths thickened and forming a bulb, yellow, woolly. Culms 20–40 cm long. Leaf-sheaths pilose, with tubercle-based hairs. Ligule a ciliate membrane, 5 mm long, lacerate. Leaf-blades 7–14 cm long, 3–6 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 3–4, digitate, erect or ascending, 3–6 cm long. Central inflorescence axis 1 cm long, pilose. Rhachis fragile at the nodes, subterete, pilose on surface, ciliate on margins. Rhachis hairs yellow. Rhachis internodes clavate, 2.5 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 4 mm long, ciliate, with 3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 6.5 mm long, 0.8 length of spikelet, coriaceous, without keels, 9–13 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume surface pilose. Lower glume margins ciliate. Lower glume hairs white or yellow. Lower glume apex dentate, 3–5 -fid, truncate. Upper glume oblong, 0.8 length of spikelet, chartaceous, 3 -veined. Upper glume lateral veins all falling short of apex. Upper glume surface scabrous, rough above, pilose, hairy below. Upper glume margins ciliate. Upper glume hairs yellow. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret lanceolate, 6 mm long, hyaline, 0 -veined, without midvein, without lateral veins, obtuse. Palea of lower sterile floret 0.1 length of lemma. Fertile lemma linear, 8 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma surface scabrous, pilose. Lemma apex lobed, 2 -fid, with lobes 2 mm long, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 15 mm long overall, with twisted column. Column of lemma awn 8 mm long, hispidulous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 3.5 mm long. Stigmas 2 or 3 (rarely).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Apocopsis intermedius (A.Camus) Chaianan. *Thai Forest Bull., Bot.*, 6: 46 (1972).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Basionym or Replaced Name: *Lophopogon intermedius* A.Camus, *Bull. Mus. Hist. Nat. Paris*, 25: 285 (1919).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 837).

Derivation (Clifford & Bostock 2007): *L. intermedius*. Having affinities with but distinct from other species.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Distribution (TDWG). **Continent.** Temperate Asia, Tropical Asia.

Country /Province /State. **China.** China South Central, China Southeast. **Indo-China.** Cambodia, Thailand, Vietnam.

Guangdong, Zhejiang. Yunnan.

Apocopsis mangalorensis (Hochst. ex Steud.) Henrard. *Blumea* 4: 523 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. **Basionym or Replaced Name:** *Amblyachyrum mangalorensis* Hochst. ex Steud., *Flora*, 39: 26 (1856). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.F. Hohenacker 231*, 1847, India (P; IT: US-865441 (fragm. ex P)).

Illustrations (Books): K.M.Matthew, Further Illustrations on the *Flora of Tamilnadu Carnatic* (1988) (Pl.710 & Pl 711).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Mangalore, Madras State, India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 6–30 cm long. Ligule an eciliate membrane. Leaf-blades 1–5 cm long, 2–3 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, erect, 1–2.5 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs dark brown. Rhachis internodes linear. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 2 mm long, ciliate (brown hairs).

Sterile Spikelets. Basal sterile spikelets well-developed, 2–3 in number, barren, larger than fertile. Basal sterile spikelet lemmas awnless.

Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 3–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, attached transversely. Spikelet callus hairs dark brown.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume cuneate, 1 length of spikelet, chartaceous to coriaceous, much thinner above, dark brown, without keels, 7 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume surface glabrous or pilose. Lower glume apex emarginate or truncate. Upper glume chartaceous.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 1 length of spikelet, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma linear, 2 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–20 mm long overall, with twisted column. Column of lemma awn hispidulous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. **Indian Subcontinent, Indo-China.** India, Sri Lanka. Myanmar. Kerala. Maharashtra, Tamilnadu.

Apocopsis paleacea (Trin.) Hochr. *Bull. N. Y Bot. Gard* 6: 262 (1910).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Basionym or Replaced Name: *Ischaemum paleaceum* Trin., *Mem. Acad. Petersb. Ser.* 6, 2: 293 (1833).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (783, Fig. 54), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 809).

Derivation (Clifford & Bostock 2007): *L. palea*, chaff; *-acea*, indicating resemblance. Glumes or lemmas, papery.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths papery or scarious. Culms 40–80 cm long. Culm-nodes glabrous. Ligule an eciliate membrane, erose. Leaf-blades linear or lanceolate, 6–12 cm long, 5–10 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scaberulous. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, paired or digitate, 1.5–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs dark brown. Rhachis internodes linear, 2 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, ciliate, with 2–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or obovate, dorsally compressed, truncate, 4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume oblong or obovate, 3.5–4.5 mm long, 0.8–1 length of spikelet, coriaceous, much thinner above, dark brown, without keels, 7 -veined. Lower glume primary vein extending to apex. Lower glume lateral veins transversely connected at apex, with some extending to apex (the outer pair). Lower glume surface asperulous. Lower glume apex truncate, mucronate (lateral veins excurrent). Upper glume oblong, 1 length of spikelet, chartaceous, dark brown, 3 -veined. Upper glume surface scabrous, rough above. Upper glume apex erose, truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 0.9 length of spikelet, hyaline, 1 -veined, without lateral veins, obtuse. Fertile lemma oblong, 3.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, muticous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4–10 mm long overall, with twisted column. Column of lemma awn hispidulous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Hainan, China Southeast. **Indian Subcontinent, Indo-China, Malesia.** Assam, Eastern Himalaya, India, Nepal. Laos, Myanmar, Thailand, Vietnam. Malaya.

Guangdong, Guangxi. Yunnan. Bhutan.

Apocopsis peguensis Bor. *Kew Bull.* 1949, 28 (1949).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Burma. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Burma. Roadside near Thitni (Old Forest Rest House) Salu reserve, Pegu Division, *U. Thein Lwin*, 59 (T:K ?; "typus in Herb. Kew et in Herb. Dehra Dun").

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Pegu, Myanmar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Culms 50–90 cm long. Lateral branches ample. Leaf-sheaths keeled, pilose, with tubercle-based hairs. Ligule an eciliate membrane, 1.5 mm long, pubescent on abaxial surface, lacerate. Leaf-blades 10–20 cm long, 4–8 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface scabrous, pubescent, densely hairy, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 2, paired, 4–7 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny, 4–5 mm long. Rhachis internodes cuneate, 1.5 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 2 mm long, ciliate, with tawny hairs, with 4–5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 7.25 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 6–7 mm long, 0.9 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume margins ciliate. Lower glume hairs 2–4 mm long. Lower glume apex truncate. Upper glume oblong, 1 length of spikelet, chartaceous, with hyaline margins, 3 -veined. Upper glume primary vein scabrous. Upper glume apex truncate.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret oblong, 5.5 mm long, hyaline, 1 -veined, without lateral veins, ciliate on margins, truncate. Fertile florets bisexual or female. Fertile lemma linear, 7 mm long, membranous, much thinner on margins, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma margins ciliate. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 30 mm long overall, with twisted column. Column of lemma awn hispidulous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 3 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Apocopsis pulcherrimus Bor. *Kew Bull.* 168 (1951).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Burma. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Burma: Tatkon, *D. Rhind* 959 (T: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. most beautiful. To be the most beautiful member of a genus.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms 10–20 cm long. Leaf-sheaths keeled, glabrous on surface. Ligule an eciliate membrane, 0.5–0.75 mm long. Leaf-blades 3–6 cm long, 3–5 mm wide, flaccid. Leaf-blade surface pubescent, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, subtended by an inflated leaf-sheath. Peduncle 3–5.5 cm long, glabrous. Racemes 2, paired, erect or ascending, 1.5–3 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny. Rhachis internodes linear, 2 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 2 mm long, ciliate, with tawny hairs, with 3–3.5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels or rudimentary.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 5.75 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 5–5.5 mm long, 0.9 length of spikelet, membranous, much thinner above, much thinner on margins,

without keels, 7 -veined. Lower glume primary vein extending to apex. Lower glume lateral veins all falling short of apex. Lower glume margins ciliate. Lower glume apex emarginate. Upper glume oblong, 1 length of spikelet, membranous, with hyaline margins, 3 -veined. Upper glume margins ciliate. Upper glume apex truncate.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret oblong, 5 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma oblong, 5.5 mm long, chartaceous, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 40 mm long overall, with twisted column. Column of lemma awn 18 mm long, pubescent. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Apocopsis schmidianus A. Camus. *Bull. Mus. Hist. Nat., Paris, Ser. 2, 29:* 187 (1957).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cambodia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cambodge: Plaine du Tonle Sap; route de Phnom Penh a Pursat, alt. 50 m., terrains sablonneux humides.,

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Ludwig Bernhard Ehregott Schmid (1788–1859) German-born Indian missionary and plant collector.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 15–18 cm long. Culm-internodes distally glabrous. Lateral branches ample. Leaf-sheaths loose, mostly shorter than adjacent culm internode, keeled, striately veined, pilose. Ligule an eciliate membrane. Leaf-blades 1–2 cm long, 1.5–2 mm wide. Leaf-blade midrib conspicuous. Leaf-blade venation with 4–6 secondary veins. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, erect, 3 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis internodes linear. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate, dorsally compressed, truncate, 4.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume obovate, 3.5–4 mm long, 0.7–0.8 length of spikelet, coriaceous, without keels, 7 -veined. Lower glume surface flat. Lower glume apex erose, truncate. Upper glume oblong, 5 mm long, 1 length of spikelet, chartaceous, light brown. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret elliptic, hyaline, truncate. Fertile lemma oblong, 2.8–3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 12–14 mm long overall, with twisted column.

Flower and Fruit. Lodicules absent. Anthers 2.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Cambodia.

Apocopsis siamensis A. Camus. *Lecomte, Not. Syst. 3:* 83 (1914).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Thailand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: C.C. Hosseus 145, 1909, Thailand (US-2117589, US-1125870, L). 1909 or 14 Oct 1904 ?.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Siam, now Thailand.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms slender, 20–45 cm long. Culm-nodes glabrous or pubescent. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule an eciliate membrane, 0.75 mm long. Leaf-blades linear or lanceolate, 2–5 cm long, 2–3 mm wide. Leaf-blade midrib keeled beneath. Leaf-blade surface hirsute, sparsely hairy, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, subtended by an inflated leaf-sheath. Peduncle 10 cm long, pilose above. Racemes 2, paired, 3–4 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny, 2–4.5 mm long. Rhachis internodes linear, 1.5 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 2.5 mm long, ciliate, with tawny hairs, with 4.5 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, truncate, 4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 0.9 length of spikelet, coriaceous, dark brown, without keels, 7 -veined. Lower glume primary vein extending to apex. Lower glume lateral veins ribbed, excurrent. Lower glume surface scabrous, rough on veins. Lower glume apex erose, truncate. Upper glume oblong, 1 length of spikelet, chartaceous, dark brown, 3 -veined. Upper glume lateral veins all falling short of apex. Upper glume margins ciliate. Upper glume apex truncate.

Florets. Basal sterile florets 1, male or barren, with palea. Lemma of lower sterile floret oblong, 4 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma oblong, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma surface scabrous. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 25–30 mm long overall, with twisted column. Column of lemma awn 14 mm long, hispidulous. Palea 3–3.25 mm long, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 2–2.5 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Thailand.

Apocopsis vaginata Hack. *Oest. Bot. Zeitschr.* 41: 8. (1891).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Hazaribagh: *Clarke 33849j*.

Illustrations (Books): G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig.3).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)

(Pl. 11).

Derivation (Clifford & Bostock 2007): *L. vagina*, sheath; *-ata*, possessing. Leaf-sheaths conspicuous.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 5–15 cm long. Leaf-sheaths inflated, pilose, with tubercle-based hairs. Ligule an eciliate membrane, lacerate. Leaf-blades linear or lanceolate, 2–3.5 cm long, 2–3 mm wide, flaccid. Leaf-blade midrib keeled beneath. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scaberulous, tuberculate-ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, subtended by a spatheole, enclosed. Peduncle glabrous. Racemes 2, paired, erect, 1–2 cm long. Rhachis fragile at the nodes, subterete, ciliate on margins. Rhachis hairs tawny, 2.5 mm long. Rhachis internodes linear, 1.5 mm long. Spikelets appressed, in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 1.5 mm long, ciliate, with tawny hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, 3.5–4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base obtuse, attached transversely.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume oblong, 3.5 mm long, 0.9 length of spikelet, chartaceous, much thinner above, without keels, 7 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins all falling short of apex. Lower glume surface pilose. Lower glume hairs tawny. Lower glume apex truncate. Upper glume oblong, 1 length of spikelet, chartaceous, light brown, 3 -veined. Upper glume surface pilose. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma oblong, 3–4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 18–24 mm long overall, with twisted column. Column of lemma awn 8–12 mm long, puberulous. Palea hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules absent. Anthers 2, 0.75–1 mm long.

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. **Indian Subcontinent, Indo-China.** Myanmar.

Bihar, Jharkhand. Madhya Pradesh, Tamilnadu, Uttah Pradesh.

Apocopsis wrightii Munro. *Proc. Am. Acad.* 4: 363 (1865).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Robert Wight (1796–1872) Scots-born physician and sometime Superintendent, Botanic Gardens, Madras.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Germainiinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths glabrous, persistent and investing base of culm, with compacted dead sheaths. Culms erect, robust, 50–100 cm long. Culm-nodes glabrous or bearded. Leaf-sheaths pilose, with tubercle-based hairs. Ligule a ciliate membrane, 1 mm long. Leaf-blades 10–20 cm long, 2–5 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, 2–4.5 cm long. Rhachis fragile at the nodes, flattened, ciliate on margins. Rhachis hairs dark brown, 3–4 mm long. Rhachis internodes linear, 1.5 mm long. Rhachis internode tip clavate. Spikelets appressed, in pairs. Fertile spikelets sessile or sessile and pedicelled, 1 in the cluster or 2 in the cluster (rarely), heteromorphic (when 2), the upper smaller (3–4mm long, terete, female). Companion sterile spikelets pedicelled, 1 in the cluster or 0 in the cluster. Pedicels present, adnate at the base to lower glume of sessile spikelet, linear, 1.5 mm long, ciliate, with 2–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate, dorsally compressed, truncate, 4.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse, attached transversely. Spikelet callus hairs dark brown.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume obovate, 4.5 mm long, 1 length of spikelet, coriaceous, much thinner above, without keels, 7–9 -veined. Lower glume primary vein falling short of apex. Lower glume lateral veins transversely connected at apex, all falling short of apex. Lower glume surface puberulous, hairy at apex. Lower glume apex truncate. Upper glume oblong, 1 length of spikelet, chartaceous, without keels, 3 -veined. Upper glume surface scabrous, rough above, puberulous, hairy at apex. Upper glume apex truncate.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret ovate, 4 mm long, 0.9 length of spikelet, hyaline, 0 -veined, without midvein, without lateral veins, pubescent, hairy above, bearing dark brown hairs, obtuse. Fertile lemma linear, 4.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma margins ciliate. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma

awn from a sinus, geniculate, 15 mm long overall, with twisted column. Column of lemma awn 10 mm long, hispidulous. Palea hyaline, without keels. Palea surface scabrous.

Flower and Fruit. Lodicules absent. Anthers 2, 2.5 mm long.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China Southeast. **Indo-China.** Myanmar, Thailand, Vietnam.

Anhui, Guangdong, Guangxi, Jiangxi, Zhejiang, Yunnan.

Arberella bahiensis T.R. Soderstrom & F.O. Zuloaga. *Brittonia* 37(1): 23 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C.E. Calderón & R.S. Pinheiro 2224*, 17 Apr 1972, Brazil: Bahia: Ibirataia Mun: (CEPEC; IT: US-2722737).

Illustrations (Journals): *Brittonia* (37: 24, Fig.1, 26, Fig.2 (1985)).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Bahia Province, Brazil.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms erect or geniculately ascending, 20–50 cm long. Culm-internodes thin-walled. Lateral branches lacking. Leaves cauline, 5–9 per branch. Leaf-sheaths outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole pilose. Leaf-blades drooping, lanceolate or ovate, 5.5–7 cm long, 21–26 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate. Monoecious, with male and female spikelets in the same inflorescence (or some all male).

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 8–10 male), terminal and axillary. Axillary inflorescences present throughout the plant. Panicle open, linear, 1.4–2.5 cm long, bearing few spikelets. Panicle branches hispid. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled, 2–3 in a cluster. Pedicels present, clavate, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, dorsally compressed, 13–14.5 mm long, 3 mm wide, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, truncate.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 13–14.5 mm long, 1.1 length of upper glume, membranous, pallid, without keels, 9 -veined. Lower glume lateral veins with cross-veins. Lower glume surface scabrous, rough above. Lower glume apex attenuate. Upper glume elliptic, 12–13 mm long, 1.6 length of adjacent fertile lemma, membranous, pallid, without keels, 7–9 -veined. Upper glume lateral veins with cross-veins. Upper glume surface scabrous, rough above. Upper glume apex acute or acuminate.

Florets. Fertile florets female. Fertile lemma elliptic, dorsally compressed, 7.3–8.1 mm long, 2.5–2.9 mm wide, indurate, yellow or light brown, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma margins pubescent. Lemma apex acute. Palea indurate. Palea apex undifferentiated or papillose.

Flower and Fruit. Lodicules 3, 0.4 mm long, membranous. Anthers 3, 2 mm long. Stigmas 2. Caryopsis light brown. Hilum linear, 1 length of caryopsis.

Male spikelets distinct from female, 1 flowered, elliptic, 4–4.5 mm long. Male spikelet glumes absent. Male spikelet lemma 3 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. Venezuela. Brazil Northeast.

Bahia.

Arberella costaricensis (Hitchcock) T.R. Soderstrom & C.E. Calderon. *Brittonia* 31 (4): 439 (1979).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. **Basionym or Replaced Name:** *Raddia costaricensis* Hitchcock, *Proc. Biol. Soc. Wash.* 40: 87 (1927). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *H. Pittier 10352*, Nov 1896, Costa Rica: Limón, in forests of the valley of the Río Hondo near Madre de dios, 200 m (US-825690; IT: 979172).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (500, Fig. 189 as *Raddia*), E.J.Judziewicz et al, *American Bamboos* (1999) (266, Fig. 162).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Costa Rica.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms geniculately ascending, 20–40 cm long, wiry. Leaves cauline, distichous. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades spreading, lanceolate, 3.5–4.5 cm long, 4.5–9 mm wide. Leaf-blade surface pilose, densely hairy, hairy abaxially, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acute. Monoecious, with male and female spikelets in the same inflorescence.

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 5–10 male), terminal and axillary. Axillary inflorescences present in upper axils or in lower axils. Panicle open, lanceolate, 1.5–2 cm long, bearing few spikelets. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, woolly, truncate.

Glumes. Glumes deciduous, similar, with lower wider than upper, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 8–9 mm long, 1 length of upper glume, membranous, pallid, without keels, 11 -veined. Lower glume apex acuminate. Upper glume elliptic, 8–9 mm long, 1.5 length of adjacent fertile lemma, membranous, pallid, without keels, 9 -veined. Upper glume apex acuminate.

Florets. Fertile florets female. Fertile lemma elliptic, dorsally compressed, 5.5 mm long, indurate, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex acute. Palea 1 length of lemma, indurate, 6 -veined.

Flower and Fruit. Lodicules 3, membranous, truncate. Anthers 3. Stigmas 2, terminally exerted, sparsely hairy.

Male spikelets distinct from female, 1 flowered, lanceolate, 3–3.7 mm long. Male spikelet glumes absent. Male spikelet lemma 3 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica, Panama.

Arberella dressleri T.R. Soderstrom & C.E.Calderon. *Brittonia* 31 (4): 433 (1979).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama, Colon: *Calderon 2085* (US holo, MO). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *C.E. Calderón 2085*, 9 Mar 1968, Panama: Colón (US-2641979; IT: MO, US-2641978).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Robert Louis Dressler (1927-) United States botanist.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms erect, 30–35 cm long, 3–6 -noded. Culm-internodes solid. Culm-nodes constricted. Lateral branches lacking. Leaves cauline. Leaf-sheaths outer margin hairy. Ligule a ciliolate membrane, 0.8 mm long. Leaf-blade base asymmetrical,

with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole pubescent. Leaf-blades lanceolate, 8–14 cm long, 15–30 mm wide. Leaf-blade surface glabrous. Leaf-blade margins serrulate, ciliate. Leaf-blade apex acute. Monoecious, with male and female spikelets in the same inflorescence (or some all male).

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 5–20 male), terminal and axillary. Axillary inflorescences present throughout the plant. Panicle open, linear, 4–8 cm long, bearing few spikelets. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled, 2 in a cluster. Pedicels present, clavate (female) or linear (male), scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 13–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, truncate.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 13–22 mm long, 1 length of upper glume, membranous, pallid, without keels, 9–11 -veined. Lower glume lateral veins with cross-veins. Lower glume apex caudate. Upper glume elliptic, 13–22 mm long, 1.5 length of adjacent fertile lemma, membranous, pallid, without keels, 8–9 -veined. Upper glume lateral veins with cross-veins. Upper glume apex caudate.

Florets. Fertile florets female. Fertile lemma lanceolate or ovate, dorsally compressed, 8.5–10.3 mm long, indurate, pallid or mid-green, mottled with last colour, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent, hairy above or below. Lemma margins pubescent, hairy below. Lemma apex apiculate. Palea lanceolate, indurate, 9–10 -veined. Palea surface pubescent, hairy on back, hairy above.

Flower and Fruit. Lodicules 3, 1.1–1.2 mm long, membranous. Anthers 3, 1.9–2 mm long. Stigmas 2. Male spikelets distinct from female, 1 flowered, linear or lanceolate, 3.2–6.4 mm long. Male spikelet glumes absent. Male spikelet lemma 3 -veined, awned, with 1 mm long awn.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Panama.

Arberella flaccida (Doell) T.R. Soderstrom & C.E. Calderon. *Brittonia* 31 (4): 443 (1979).

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R. Spruce* 2649, Oct 1852-Jan 1853, Brazil: prope Panur?(K; IT: F, GH, US-1126095, US-1445715, US-2603499, US-132869).

Illustrations (Books): E. Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (60, Fig. 7).

Derivation (Clifford & Bostock 2007): L. unable to support its own weight. Inflorescence branches long and thin and so droop.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms geniculately ascending, 15–27 cm long, 3–4 -noded. Culm-internodes solid. Culm-nodes constricted. Lateral branches lacking. Leaves cauline, 5–8 per branch. Leaf-sheaths ribbed. Ligule a ciliolate membrane, 0.4–0.6 mm long, truncate. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.1 cm long, petiole glabrous. Leaf-blades lanceolate or ovate, 4–5 cm long, 8–10 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate. Leaf-blade apex acute. Monoecious, with male and female spikelets in the same inflorescence (or some all male).

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 5–8 male), terminal and axillary. Axillary inflorescences present throughout the plant. Panicle open, linear, 4–5 cm long, bearing few spikelets. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled, 1–2 in a cluster. Pedicels present, clavate (female) or linear (male).

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate or obovate, dorsally compressed, 8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, truncate.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma, incurved at apex. Lower glume elliptic, 8.5 mm long, 1.05 length of upper glume, membranous, pallid, without keels, 5–6 -veined. Lower glume lateral veins with cross-veins. Lower glume apex attenuate. Upper glume elliptic, 8 mm long, 1.6 length of adjacent fertile lemma, membranous, pallid, without keels, 5–6 -veined. Upper glume lateral veins with cross-veins. Upper glume apex attenuate.

Florets. Fertile florets female. Fertile lemma elliptic or ovate, dorsally compressed, 5 mm long, indurate, pallid, shiny, without keel, 5 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface pubescent, hairy at base. Lemma margins pubescent. Lemma apex acute. Palea indurate.

Flower and Fruit. Lodicules 3, 0.5 mm long, membranous. Anthers 3, 1.8–2 mm long. Stigmas 2.

Male spikelets distinct from female, 1 flowered, linear or lanceolate, 3.7–4 mm long. Male spikelet glumes absent. Male spikelet lemma 5 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. French Guiana, Guyana, Surinam. Colombia. Brazil North, Brazil South.

Amazonas, Acre, Rondonia. Mato Grosso. Amazonas, Rondonia. Rio Grande do Sul.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica, Piedras Blancas to Rincon de Osa: *Grayum et al. 3402* (MO holo, CR, US). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M.H. Grayum, J. Jacobs, G. Schatz, J. Kress & P. Sleeper 3402*, 2 Jul 1984, Costa Rica: Puntarenas (MO; IT: CR, US-3215620).

Illustrations (Journals): *Novon* (2: 95, Fig. 6 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Michael Howard Grayum (1949-) United States botanist.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms erect or geniculately ascending, 35–50 cm long, 4–5 -noded. Culm-internodes terete, thin-walled, glandular (spot near node). Culm-nodes black, glabrous. Lateral branches lacking. Culm-sheaths present. Leaves cauline, 5–8 per branch, distichous. Leaf-sheaths hirsute. Ligule a ciliate membrane, 0.2–0.4 mm long. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.1–0.15 cm long, petiole pilose. Leaf-blades elliptic or oblong, 5–10 cm long, 16–30 mm wide. Leaf-blade surface pilose, sparsely hairy or moderately hairy, hairy abaxially or on both sides. Leaf-blade apex acuminate. Monoecious, with male and female spikelets in the same inflorescence (or some all male).

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 8–16 male), terminal and axillary, with 1–5 peduncles per sheath. Axillary inflorescences present in upper axils. Panicle open, linear, 1.5–4 cm long, bearing few spikelets. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled, 2 in a cluster. Pedicels present, linear (male) or clavate (female).

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 13.5–15 mm long, 2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, glabrous, truncate.

Glumes. Glumes deciduous, similar, with lower wider than upper, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 13.5–15 mm long, 1 length of upper glume, membranous, pallid, without keels, 7 -veined. Lower glume lateral veins with cross-veins. Lower glume apex attenuate. Upper glume lanceolate, 13.5–15 mm long, 1.6 length of adjacent fertile lemma, membranous, pallid, without keels, 7 -veined. Upper glume lateral veins with cross-veins. Upper glume apex attenuate.

Florets. Fertile florets female. Fertile lemma elliptic or oblong, dorsally compressed, 8.7 mm long, 2.3 mm wide, indurate, pallid, shiny, without keel. Lemma surface with distinct germination flap, pubescent, hairy below. Lemma margins ciliate. Lemma apex acute. Palea 1 length of lemma, indurate, 4 -veined.

Flower and Fruit. Lodicules 3, 1 mm long, membranous, veined. Anthers 3, 1.2–1.6 mm long. Stigmas 2.

Male spikelets distinct from female, 1 flowered, linear or lanceolate, 3.8–5.2 mm long, glabrous. Male spikelet glumes absent. Male spikelet lemma 3 -veined, awned, with 0.1–0.5 mm long awn.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica.

Arberella lancifolia T.R. Soderstrom & F.O. Zuloaga. *Brittonia* 37(1): 25 (1985).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama, El Llano: *Dressler 4276* (PMA holo, K, MO, NY, SI, US). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.L. Dressler 4276*, 20 Feb 1973, Panama: Panama (PMA; IT: K, MO, NY, SI, US-2850469).

Illustrations (Journals): *Brittonia* (37: 28, Fig.3 (1985)).

Derivation (Clifford & Bostock 2007): *L. lanceus*, lance; *folium*, leaf. Leaf-blade lanceolate.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms erect or geniculately ascending, 30–40 cm long, 3–4 -noded. Culm-internodes thin-walled. Culm-nodes brown. Lateral branches lacking. Leaves cauline, 4–8 per branch. Leaf-sheaths outer margin hairy. Ligule a ciliate membrane, 0.5–0.7 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2 cm long, petiole pilose. Leaf-blades linear or lanceolate, 10–14.5 cm long, 8–13 mm wide. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade apex acuminate. Monoecious, with male and female spikelets in the same inflorescence (or some all male).

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 8–10 male), terminal and axillary. Axillary inflorescences present in upper axils or in lower axils. Panicle open, linear, 1.5–2 cm long, bearing few spikelets. Panicle branches pubescent. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled, 2 in a cluster. Pedicels present, clavate (female) or linear (male), ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 18–20 mm long, 2.1–2.9 mm wide, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, truncate.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 18–20 mm long, 1.1 length of upper glume, membranous, pallid, without keels, 9 -veined. Lower glume lateral veins with cross-veins. Lower glume surface scabrous, rough at apex. Lower glume apex acuminate. Upper glume elliptic, 16–18 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, pallid, without keels, 9–10 -veined. Upper glume lateral veins with cross-veins. Upper glume apex acuminate.

Florets. Fertile florets female. Fertile lemma lanceolate, dorsally compressed, 10.8–12.6 mm long, 2.5 mm wide, indurate, pallid, shiny, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins pubescent. Lemma apex acuminate. Palea indurate, 8–9 -veined. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 3, 1 mm long, membranous. Anthers 3, 1.7 mm long. Stigmas 2.

Male spikelets distinct from female, 1 flowered, lanceolate, 5–6.7 mm long. Male spikelet glumes absent. Male spikelet lemma 3 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Panama.

Arberella venezuelae E.J. Judziewicz & G. Davidse. *Novon* 1(2): 76 (1991).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela, Salto Yureba: *Guánchez 1667* (MO holo, VEN). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela: Amazonas: Dept. Atabapo: 2 km abajo del Salto Yureba del Bajo [Río] Ventuari, 4.03N 66.02W, localmente frecuente en el sotobosque, 100–200 m, 24 Mar 1982, *Guánchez 1667* (HT: MO; IT: VEN).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (29, Fig. 11).

Illustrations (Journals): *Novon* (1:77, Fig.1 (1991)).

Derivation (Clifford & Bostock 2007): from Venezuela.

Classification. Subfamily Bambusoideae. Tribe: Olyreae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths absent. Culms erect or geniculately ascending, 40–60 cm long. Culm-internodes thin-walled, distally glabrous or pubescent. Culm-nodes pubescent. Lateral branches lacking. Leaves cauline, 5–7 per branch. Leaf-sheaths striately veined, glabrous on surface or hispid, outer margin hairy. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blade base cuneate, asymmetrical, with a brief petiole-like connection to sheath, petiole 0.2 cm long, petiole pubescent. Leaf-blades lanceolate or ovate, 8–10.5 cm long, 25–35 mm wide. Leaf-blade venation with 6–10 secondary veins. Leaf-blade surface glabrous or puberulous, hairy abaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate. Monoecious, with male and female spikelets in the same inflorescence.

Inflorescence. Inflorescence a panicle, comprising 1 fertile spikelets (and 3–5 male), terminal and axillary, embraced at base by subtending leaf, with 3–6 peduncles per sheath. Panicle contracted, linear, 1–2 cm long, bearing few spikelets. Primary panicle branches indistinct the panicle almost racemose. Sexes segregated, on unisexual branches, with male below. Spikelets solitary. Fertile spikelets pedicelled. Male spikelets pedicelled. Pedicels present, clavate (female) or filiform (male).

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, dorsally compressed, 9–12.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4–0.7 mm long, truncate.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–12.5 mm long, 1.1 length of upper glume, chartaceous, pallid, without keels, 7–9 -veined. Lower glume apex attenuate, awned, 1 -awned, awn 1–3 mm long. Upper glume lanceolate, 8–10 mm long, 1.3–1.5 length of adjacent fertile lemma, chartaceous, pallid, without keels, 5–7 -veined. Upper glume apex acuminate.

Florets. Fertile florets female. Fertile lemma elliptic, dorsally compressed, 6–6.7 mm long, 2.3–2.5 mm wide, indurate, pallid, shiny, without keel. Lemma surface pubescent, hairy above and at base. Lemma margins pubescent. Lemma apex acute. Palea indurate. Palea surface glabrous or puberulous, hairy above.

Flower and Fruit. Lodicules 3, 0.3 mm long, membranous. Anthers 3, 2–2.5 mm long. Stigmas 2.

Male spikelets distinct from female, 1 flowered, linear or lanceolate, 4–5 mm long. Male spikelet glumes absent. Male spikelet lemma 3 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Arctagrostis arundinacea (Trin.) Beal. *Grasses N. Amer.* 2: 317 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Basionym or Replaced Name: *Vilfa arundinacea* Trin., *Gram. Unifl.* 157 (1824).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. arundo*, reed; *-acea*, like. Culm tall, thereby resembling a reed.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 100–150 cm long, with 0.5 of their length below uppermost node. Culm-internodes distally glabrous. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades 7–8 mm wide. Leaf-blade surface scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 10–20 cm long, 3–5 cm wide. Primary panicle branches 8–10 cm long, bearing 15–20 fertile spikelets on each lower branch, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 0.75 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 2.4–3.6 mm long, 0.75–0.9 length of adjacent fertile lemma, hyaline, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.4–3.6 mm long, membranous, much thinner above, keeled, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma lateral veins obscure, less than two thirds length of lemma. Lemma surface scaberulous, hispidulous. Lemma apex obtuse. Palea 1 length of lemma, 2 -veined. Palea keels scaberulous. Palea surface puberulous.

Flower and Fruit. Anthers 3, 1–2.4 mm long. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, North America.

Country /Province /State. Siberia, Russian Far East. Chita, Krasnoyarsk. Magadan. **Subarctic America.** Alaska.

Arctagrostis latifolia (R.Br.) Griseb. Ledeb. *Fl. Ross.* 4: 434 (1852).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Basionym or Replaced Name: *Colpodium latifolium* R. Br., Parry, *1st Voy. Suppl.* p. 186 (1824).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (677 as ssp. *arundinacea* & ssp. *latifolia*).

Derivation (Clifford & Bostock 2007): *L. latus*, broad; *folium*, leaf. Leaf-blades broad or relatively broad with respect to related species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms 15–120 cm long. Ligule an eciliate membrane, 2–5 mm long, lacerate. Leaf-blades 10–15 cm long, 6–12 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, 3–10 cm long. Primary panicle branches 3–5 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 2.5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.75 length of upper glume, hyaline, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 0.75 length of adjacent fertile lemma, hyaline, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma oblong, 2.5–6 mm long, membranous, much thinner above, purple, keeled, 3 -veined, 0–3 -veined. Lemma lateral veins obscure, less than two thirds length of lemma. Lemma surface scaberulous. Lemma apex obtuse. Palea 1 length of lemma, 2 -veined. Palea keels scaberulous. Palea apex obtuse.

Flower and Fruit. Anthers 3, 2 mm long, purple. Ovary glabrous.

$2n = 56$ (3 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Temperate Asia, North America.

Region. Northern Europe, Eastern Europe.

Country /Province /State. : Finland, Norway, Svalbard. North European Russia. Siberia, Russian Far East, **Mongolia.** Buryatiya, Irkutsk, Krasnoyarsk, Tuva. Amur, Kamchatka, Magadan. **Subarctic America, Western Canada, Eastern Canada.** Aleutian Is, Alaska, Yukon, Northwest Territories, Nunavut, Greenland. Alberta, British Columbia, Manitoba, Labrador, Quebec.

Arctophila fulva (Trin.) Anderss. *Gram. Scand.* 10 :49 (1852).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Basionym or Replaced Name: *Poa fulva* Trin., *Mem. Acad. Petersb. Ser.* 6(1) 378. (1831).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (606).

Derivation (Clifford & Bostock 2007): L. brown, deep yellow. Usually a reference to spikelet color.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 15–80 cm long. Ligule an eciliate membrane. Leaf-blades 5–20 cm long, 2–13 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal or ovate, 4–17 cm long. Primary panicle branches ascending or drooping or reflexed. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, linear or oblong.

Fertile Spikelets. Spikelets comprising 2–6 fertile florets, without rhachilla extension or with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or ovate, laterally compressed, 2.5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 0.75 length of upper glume, membranous, 1-keeled, (1–)3 -veined. Lower glume apex acute. Upper glume ovate, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma oblong, 2–4 mm long, membranous, much thinner above, yellow, keeled, lightly keeled, 3 -veined, 0–3 -veined. Lemma lateral veins obscure, less than two thirds length of lemma. Lemma apex erose, acute. Palea 0.75 length of lemma, 2 -veined. Palea keels smooth. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 1 mm long. Caryopsis with adherent pericarp. Hilum elliptic.

$2n = 42$ (3 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Temperate Asia, North America.

Region. Northern Europe, Eastern Europe.

Country /Province /State. : Finland, Svalbard, Sweden. North European Russia. Siberia, Russian Far East. Krasnoyarsk. Kamchatka, Magadan. **Subarctic America, Western Canada, Eastern Canada.** Aleutian Is, Alaska, Yukon, Northwest Territories, Nunavut, Greenland. Manitoba. Labrador, Ontario, Quebec.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (599).

Derivation (Clifford & Bostock 2007): L. *emineo*, stand out. Conspicuous with respect to inflorescence.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated. Culms erect, robust, 50–130 cm long, 3–6 mm diam. Culm-internodes terete, smooth. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 1.2–3 mm long. Leaf-blades 10–25 cm long, 4–11 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, elliptic, 9–24 cm long. Primary panicle branches ascending, bearing spikelets almost to the base. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 7–11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes smooth. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 5–6 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute. Upper glume elliptic, 7–8 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Fertile lemma elliptic, oblong in profile, 7–8 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma midvein ciliate. Lemma surface puberulous to pilose. Lemma margins ciliate. Lemma apex acute. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 2.3–4 mm long. Caryopsis with adherent pericarp. Hilum punctiform.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 362 as *P. tibetica* var. *tibetica*).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Tibet.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths herbaceous, persistent and investing base of culm, with fibrous dead sheaths. Culms erect or geniculately ascending, 17–65 cm long. Culm-internodes terete, smooth. Lateral branches lacking. Leaves mostly basal. Ligule an eciliate membrane, 2–4.5 mm long, lacerate. Leaf-blades conduplicate or convolute, 6–20 cm long, 4–5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–12 cm long. Primary panicle branches appressed, 2–4 -nate. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or oblong, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes smooth. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate or elliptic, 2.8–4.5 mm long, 0.8 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex erose, acute. Upper glume lanceolate or elliptic, 3.5–5.5 mm long, 0.9 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex erose, acute.

Florets. Fertile lemma ovate, elliptic in profile or oblong in profile, 4–5.25 mm long, membranous, keeled, 5 -veined, more than 3-veined. Lemma midvein ciliate. Lemma surface asperulous. Lemma margins ciliate. Lemma apex acute. Palea 0.9 length of lemma. Palea keels scabrous or spinulose, adorned below (spinulose). Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5–2.5 mm long. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Siberia, **Middle Asia, Western Asia, China, Mongolia, Russia.** Altay, Irkutsk, Tuva. Kazakhstan, Kirgizistan, Turkmenistan, Tadjikistan. Iran. Inner Mongolia, China North-Central, Qinghai, Tibet, Xinjiang. Mongolia. **Indian Subcontinent.** Eastern Himalaya, Nepal, Pakistan.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Ernst Rudolf Trautvetter (1809–1889) Russian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 17–65 cm long. Culm-internodes terete, smooth. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths tubular for much of their length. Ligule an eciliate membrane, 2–4.5 mm long. Leaf-blades conduplicate or convolute, 6–20 cm long, 4–5 mm wide. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, dense, 5–15 cm long, 1–7 cm wide. Primary panicle branches appressed, 2–4 -nate. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic or oblong, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes smooth. Floret callus glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate or elliptic, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex erose, acute. Upper glume lanceolate or elliptic, 0.9 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex erose, acute.

Florets. Fertile lemma ovate, 4–5.25 mm long, membranous, keeled, 7 -veined, more than 3-veined. Lemma midvein ciliate. Lemma surface asperulous, pilose, hairy on veins. Lemma margins ciliate. Lemma apex acute. Palea 0.9 length of lemma. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 1.5–2.5 mm long. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia. Krasnoyarsk.

Aristella keniensis (Pilger) M. Ro`ser & H.R. Hamasha. *Pl. Stst. Evol.* 298: 365 (2012).

TYPE from South Africa. **Basionym or Replaced Name:** *Oryzopsis keniensis* Pilg., *Notizbl. Bot. Gart. Berlin-Dahlem* 9(87): 509 (1926). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Kenia, Westseite: Nieri-Wald, 21 Dec 1922, *R.E. Fries & T.C.E. Fries* 248.

Recent Synonyms: *Stipa keniensis* (Pilger) H. Freitag, *Davis & Hedge Festschrift* (ed. Kit Tan): 122 (1989).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (14, Fig 7).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Kenya.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Rhizomes short, knotty. Culms 90–150 cm long. Leaves cauline. Ligule an eciliate membrane, 3–5 mm long. Leaf-blades 30–60 cm long, 6–12 mm wide. Leaf-blade surface glabrous or hirsute, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, dense or loose, 15–40 cm long. Primary panicle branches naked below or bearing spikelets almost to the base. Panicle branches straight or flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–7 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute to acuminate. Upper glume lanceolate, 6–7 mm long, 1.2 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume apex acute to acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex

dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 10–15 mm long overall. Palea elliptic, 0.8 length of lemma, coriaceous, 2 -veined, without keels. Palea surface pilose.

Flower and Fruit. Lodicules 3, oblanceolate, membranous. Anthers 3. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp, fusiform. Embryo 0.1–0.2 length of caryopsis. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa, Southern Africa. Ethiopia (inc. Eritrea), Somalia. Kenya.

Aristida abnormis Chiov. *Annuario Reale Ist. Bot. Roma* 8(1): 48, t. 6. 1903.

ST: *Pappi* 2668, 13 Apr 1892, Eritrea: Assaorta: Aleita (FI, US (photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ab-*, away from; *norma*, model. Differing from the expected.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 10–30(–40) cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 5–10 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 5–10 cm long, with spikelets clustered towards branch tips. Primary panicle branches appressed or ascending, 1–2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–10(–14) mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5.5–10 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5.5–10 mm long, 0.7–0.8 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma elliptic, subterete, 7–10(–14) mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1 -awned or 3 -awned. Principal lemma awn curved or 3-branched, with (7.5–)15–25 mm long limb, with twisted column, persistent. Column of lemma awn 3.5–10 mm long. Lateral lemma awns absent or present, 0–15 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Northeast Tropical Africa. Djibouti, Eritrea, Somalia. **Western Asia, Arabian Peninsula.** Iran. Gulf States, Oman. **Indian Subcontinent.** Pakistan.

Illustrations (Journals): *Darwiniana* (41: 158, fig.1 &160, fig.2 (2003)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Sierra Achala, Argentina.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 55–70 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.1 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or conduplicate (upper), 20–25 cm long, 1.5–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, smooth.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 12–16 cm long. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, (0.5–)0.6 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper, rarely subequal). Lower glume lanceolate, 11–14 mm long, 1 -veined. Lower glume surface asperulous, rough generally. Lower glume apex acuminate (shortly awned), mucous. Upper glume lanceolate, 10.2–12.5 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acuminate (shortly awned).

Florets. Fertile lemma subterete, 4–5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, with a median groove (ventral, longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 16–20 mm long limb, with twisted column. Column of lemma awn 2–3.2 mm long. Lateral lemma awns present, ascending, 14–16.5 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Derivation (Clifford & Bostock 2007): *L. acuo*, sharpen; glumes sharp-pointed.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 40–125 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 3–4 mm long. Ligule a fringe of hairs, 0.5 mm long. Collar glabrous or pubescent. Leaf-blades filiform, involute, 7–13 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or elliptic, 15–30 cm long, 1–10 cm wide. Primary panicle branches 3–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7.7–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, hairy on the surface or on the margins, acute.

Glumes. Glumes deciduous, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7.7–15 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or obscure. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1–3 mm long. Upper glume lanceolate, 6.5–14 mm long, 1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1–3 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–9 mm long, coriaceous, pallid or light brown, concolorous or mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 13–22 mm long limb, without a column, persistent. Lateral lemma awns present, 9–18 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 4.5–6 mm long. Hilum linear, 0.2 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland, New South Wales. North, Central, South East. Coast, Tablelands.

Aristida adoensis Hochst. In sched., Schimp. *Iter Abyss.* 3:1806 (1844).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *Schimper 1806*, 10 Oct 1840, Ethiopia: in planitie montana Shire (K).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 357 as *A. coerulescens*), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (79, Fig 33).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Ado, Ethiopia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 25–60(–120) cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades involute, 5–25 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or oblong, continuous or interrupted, 5–20 cm long, 1 cm wide. Panicle branches pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–11 mm long, 0.9–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, muticous or mucronate or awned, awn 0–2 mm long. Upper glume lanceolate, 8–11 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, muticous or mucronate or awned, 1 -awned, awn 0–2 mm long.

Florets. Fertile lemma elliptic, subterete, 6–8 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 15–22 mm long limb, without a column, persistent. Lateral lemma awns present, 15–22 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Burundi, Rwanda, DRC. Eritrea, Ethiopia (inc. Eritrea), Sudan. Kenya, Tanzania, Uganda.

Images: L.Boulos, *Flora of Egypt* 4 (2005);, F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): from Ascension Island in the Atlantic Ocean.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual or perennial. Culms erect or geniculate ascending or decumbent, 10–100 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Ligule a fringe of hairs. Leaf-blades flat or conduplicate, 5–20 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, elliptic, 10–30 cm long, evenly furnished or contracted about primary branches. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.8 length of upper glume, scarios, 1-keeled, 1 - veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex emarginate or acute, muticous or mucronate. Upper glume lanceolate, 5–10 mm long, 0.75–1 length of

adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma elliptic, laterally compressed, 5–13 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 7–25 mm long limb, persistent. Lateral lemma awns present, 5–25 mm long, subequal to principal or shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Aristida aemulans Melderis. *Bol. Soc. Brot.*, Ser. 2, 44: 285 (1970).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zaire. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Zaire, Elizabethville: *Gathy* 1165 (K holo, SRGH).

Illustrations (Books): G.V.Pope et al., *Flora Zambesiaca* 10 (1(1971):103, t. 30).

Derivation (Clifford & Bostock 2007): *L. aemulor*, come near to. Rather similar to another species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–70 cm long, 2–3 -noded. Culm-internodes distally glabrous. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades curled, 20–40 cm long, 2–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, interrupted, 13–20 cm long. Primary panicle branches 1-nate, 3–5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3–0.4 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–4 mm long, 0.6–0.8 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex emarginate or obtuse or acute, mucronate. Upper glume lanceolate, 6–7 mm long, 1.7–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous, rough above. Upper glume apex emarginate or obtuse or acute, mucronate.

Florets. Fertile lemma elliptic, subterete, 3.5–4 mm long, coriaceous, keeled, 3-veined, 0–3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex rostrate, with a short cylindrical neck, with this appendage 0.5–1 mm long, awned, 3-awned. Principal lemma awn 3-branched, with 12–15 mm long limb, persistent. Lateral lemma awns present, 8–10 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, South Tropical Africa. DRC. Zambia.

Aristida aequiglumis Hack. ex Schinz. Bull. Herb. Boiss. 3: 381. (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Africa, Kuduspoort: *Rehmann* 4696.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. aequus*, equal; gluma, husk. Glumes subequal.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 30–40 cm long, 3–4-noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 5–15 cm long, 1–1.5 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or oblong, 6–15 cm long. Primary panicle branches 1–2-nate, 2–4 cm long, bearing 1–3 fertile spikelets on each lower branch. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.5–9.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets or reaching apex of florets, thinner than fertile lemma, parallel to lemmas or recurved at apex. Lower glume lanceolate, 5–9 mm long, 0.9–1 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acuminate, awned, 1-awned, awn 0.5–1.5 mm long. Upper glume lanceolate, 5.5–9.5 mm long, 1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex dentate, 2-fid, mucronate.

Florets. Fertile lemma elliptic, subterete, 6–7 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 15–25 mm long limb, with twisted column, persistent. Column of lemma awn 2–8 mm long. Lateral lemma awns present, 13–20 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Zambia, Zimbabwe. Limpopo, North-West, Gauteng, Mpumalanga.

Aristida alpina L. Liou. *Fl. Xizangica*, 5: 82 (1987).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 635).

Derivation (Clifford & Bostock 2007): *L. alpes*, high mountain; *-ina*, belonging to. Species growing at high altitudes.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 12–22 cm long, 0.5–1 mm diam., 1–2 -noded. Leaves mostly basal. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs. Leaf-blades involute, 10–30 cm long, 1–2 mm wide, glaucous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 3.5–7.5 cm long. Primary panicle branches 1–2 -nate, bearing 2–4 fertile spikelets on each lower branch. Panicle axis scaberulous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 1–10 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acuminate. Upper glume lanceolate, 12 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 10 mm long, coriaceous, dark brown or black, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn straight, with 10 mm long limb, persistent. Lateral lemma awns present, 3–5 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Tibet.

Aristida amazonensis H.M. Longhi-Wagner. *Kew Bull.* 49(4): 817 (1994).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Amazonas: Estrada do Estanho, road to Igarapi Preto, ca. 60 km SE of Transamazon Highway, 2 Jul 1979, *Caldersn, Monteiro & Guedes 2739* (HT: K; IT: BR, NY, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Amazonas, Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 35–47 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.1 mm long. Collar glabrous. Leaf-blades straight, conduplicate, 10–14 cm long, 1.8–2 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially. Leaf-blade apex obtuse, smooth.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), 15–29 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.8 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper sometimes subequal). Lower glume lanceolate, 6.5–8 mm long, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acute (shortly awned), mucous or mucronate. Upper glume lanceolate, 6.2–7(–7.8) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute (shortly awned).

Florets. Fertile lemma subterete, 8–9 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight (or slightly bent), ascending or spreading, simple at base, with 16.5–20 mm long limb, without a column. Lateral lemma awns present, ascending, 14.2–18 mm long, shorter than principal (slightly).

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil North. Amazonas.

Aristida ambongensis A. Camus. *Bull. Soc. Bot. France*, 78: 435. (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar cent.: Stompiku (Ambongo) sables trhs secs et dicouverts, *Perrier de la Bathie 11092*.

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (101, Fig. 28).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Ambongo, Madagascar.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect or geniculately ascending, 40–75 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 15–20 cm long, 1–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–15 cm long, 1 cm wide. Primary panicle branches appressed, 1–3 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 15–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 15–17 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 17–19 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 0–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–45 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 8–13 mm long. Lateral lemma awns present, 30–35 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Aristida amplexifolia E. Sanchez. *Darwiniana* 19(3–4): 413 (1975).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Argentina: Jujuy: Dpartamento Yavi: Cerro Colorado, 21 Feb 1971, *B.J. Ruthsatz IX-25* (HT: BAF; IT: BAA).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. amplexus*, encircling; *folium*, leaf. Leaf-blades cordate and amplexicaule.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 20–30 cm long, 3-noded. Culm-internodes elliptical in section. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 3 mm long. Ligule a fringe of hairs. Collar pubescent. Leaf-blades straight or curved or flexuous, conduplicate, 8–17 cm long, 0.5–1 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough on both sides. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 8–12 cm long. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 7.5–11 mm long, 0.75 length of upper glume, membranous, 3-veined. Lower glume primary vein ciliolate. Lower glume surface asperulous, rough on veins. Lower glume apex entire or dentate, 2-fid, mucronate. Upper glume linear or lanceolate, 10–13 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, 1-veined. Upper glume lateral veins absent. Upper glume apex entire or dentate, 2-fid, mucronate.

Florets. Fertile lemma linear, subterete, 8.5–9 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3-awned. Principal lemma awn with 17–20 mm long limb. Lateral lemma awns present, 13–15 mm long, shorter than principal. Palea 1.5 mm long, 0.15 length of lemma, hyaline, 0-veined.

Flower and Fruit. Lodicules 2, 1 mm long. Anthers 3, 2 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest.

Jujuy.

Aristida anaclasta T.A. Cope. *Kew Bull.*, 39(4): 833 (1984).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online.

TYPE from Socotra. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Socotra: *Radcliffe-Smith / Lavranos* 605 (K holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *Gk ana*, not; *klastos*, broken in pieces. Awn without an articulation.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 25–35 cm long. Ligule a fringe of hairs. Leaf-blades curled, aciculate, involute, 2–5 cm long, 1 mm wide, coriaceous, stiff.

Inflorescence. Inflorescence a panicle, comprising 6–7 fertile spikelets. Panicle open, ovate, 5–7 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–10.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 7–8 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume apex dentate, 2-fid, mucronate. Upper glume lanceolate, 8.5–9 mm long, 0.8–0.9 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume apex dentate, 2-fid, mucronate.

Florets. Fertile lemma lanceolate, subterete, 10–10.5 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea.

Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 12–16 mm long limb, without a column, persistent. Lateral lemma awns present, spreading less than principal, 9–10 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Socotra.

Aristida anisochaeta W. D. Clayton. *Kew Bull.* 23: 211 (1969).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ethiopia, Uardere: *Ellis* 38 (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *anisos*, unequal; *chaete*, bristle. Central branch of trifold awn much longer than the two laterals.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40–60 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades convolute, 3–9 cm long, 0.5–1.5 mm wide, stiff, glaucous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 8–10 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1 mm long, pubescent, with longer hairs above, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–7 mm long, 0.4–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume linear, 10–12.5 mm long, 3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3.5–4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 45–65 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 5 mm long. Lateral lemma awns present, 8–12 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Eritrea, Somalia.

Aristida annamensis Henrard. *Meded. Herb. Leid.* No. 54, 28 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Annam now included within Vietnam.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long, 1–2 mm diam. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, smooth, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat or convolute, 10–35 cm long, 1–1.5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins cartilaginous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 25–50 cm long, 10–20 cm wide, with spikelets clustered towards branch tips. Primary panicle branches 2–3 -nate. Panicle axis scabrous.

Panicle branches flexuous, bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11.5 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 2 mm long. Upper glume lanceolate, 10.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2 mm long.

Florets. Fertile lemma linear or lanceolate, subterete, 9 mm long, coriaceous, without keel. Lemma surface punctate. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 20 mm long limb, without a column or with a straight or slightly twisted column, persistent. Column of lemma awn 0–1 mm long. Lateral lemma awns present, 13 mm long, shorter than principal. Palea absent or minute.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Vietnam.

Aristida annua B.K. Simon. *Austrobaileya* 2(1): 87 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Queensland: Leichardt Dist.: Gindie via Springsure, 29 Mar 1958, P. J. Skerman s.n. (HT: BRI-11772).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (115, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 211, Fig.15 (1992)).

Derivation (Clifford & Bostock 2007): L. annual. Annuals.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms 25–50 cm long, 2–3 -noded. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Ligule a fringe of hairs, 1 mm long. Leaf-blades 7–15 cm long, 1–1.5 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–20 cm long, 5–12 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute. Floret callus hairs 1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.5–7.5 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1–1.5 mm long. Upper glume lanceolate, 7–8.5 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous or scabrous. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1–1.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 5.5–6.5 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 8–12 mm long limb, without a column, persistent. Lateral lemma awns present, 8–12 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Australasia.
Country /Province /State. Australia. Queensland.
Central.

Aristida anthoxanthoides (Domin) Henrard. *Meded. Herb. Leid.* No. 54, 10, 29 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Aristida adscensionis* var. *anthoxanthoides* Domin, *Bibliotheca Botanica* 85(2): 343, t. 15, f. 9–12 (1915). Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Anthoxanthum*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms 15–30 cm long, 2–3 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs, 0.5 mm long. Collar glabrous. Leaf-blades 4–9 cm long, 1.5 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 8 cm long, 2.5–4 cm wide. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex emarginate or acute or acuminate. Upper glume lanceolate, 4–7 mm long, 0.8–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex acute or acuminate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 10–15 mm long limb, without a column, persistent. Lateral lemma awns present, 10–15 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 5–6 mm long. Hilum linear, 0.2–0.3 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, Northern Territory, South Australia, Queensland, New South Wales.

Eremean. Central Australia. NW & Lake Eyre, Southern. North, Central, Inland. Western Plains.

Illustrations (Journals): *Darwiniana* (41: 164, fig.3 (2003)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From San Antonio, Puno Province, Peru.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–30 cm long, 0 -noded. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades convolute, 2–12 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 3–7 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10–11 mm long, 1 length of upper glume, membranous. Lower glume primary vein ciliolate. Lower glume surface scabrous. Lower glume apex acute, muticous or mucronate. Upper glume linear, 10–11 mm long, 1.1 length of adjacent fertile lemma, membranous. Upper glume primary vein ciliolate. Upper glume surface scabrous. Upper glume apex acute, muticous or mucronate.

Florets. Fertile lemma linear, subterete, 8–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 12–18 mm long limb. Lateral lemma awns present, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Western South America, Southern South America.** Bolivia, Peru. Argentina Northeast.

Jujuy, Salta, Tucuman.

Aristida appressa Vasey. *Contrib. U. S. Nat. Herb.* 1: 282. (1893).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E. Palmer s.n.*, 1885, Mexico: Jalisco: Guadalajara (US-745676; IT: L (fragm.), W). Collection date in error for 1886.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. appressed. Lateral branches of panicle held erect.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with curly dead sheaths. Culms 30–60 cm long. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat or involute, 10–35 cm long, 1–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, equilateral or nodding, 10–25 cm long. Primary panicle branches appressed or ascending, 2–10 cm long. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets linear, subterete, 12–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–11 mm long, 0.75 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate, muticous or awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 12–14 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate, muticous or awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma linear, subterete, 8–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 15–22 mm long limb, with twisted column. Column of lemma awn (2–)4–8 mm long. Lateral lemma awns present, 15–22 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Southwest Mexico, Southeast Mexico. **Mesoamerica.** Belize, Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panama.

Distrito Federal, Mexico State, Morelos, Puebla. Guanajuato, Zacatecas. Guerrero, Jalisco, Michoacan, Nayarit. Chiapas, Yucatan.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Aruba, a Caribbean island.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, 20–30 cm long. Culm-internodes smooth. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, smooth. Leaf-sheath oral hairs bearded. Ligule a fringe of

hairs. Leaf-blades curved, convolute, 10–20 cm long, 2 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, exserted or embraced at base by subtending leaf. Panicle open, linear or lanceolate, 5–10 cm long, 1 cm wide, contracted about primary branches. Primary panicle branches 1–2 -nate. Panicle axis smooth. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11–12 mm long, 1.5 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 8 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 6.5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 20–25 mm long limb. Lateral lemma awns present, 17–20 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Aruba.

Aristida asplundii Henrard. *Meded. Herb. Leid.* No. 54, 42 (1926).

Illustrations (Journals): *Darwiniana* (41: 167, fig.4 (2003) as var. *pauciflora*).

Derivation (Clifford & Bostock 2007): L. in honor of Erik Asplund (1888–1974) Swedish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms geniculately ascending, 10–15 cm long. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, striately veined, smooth. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Collar pubescent. Leaf-blades filiform, convolute, 2–4 cm long, 1 mm wide, stiff, glaucous. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins unthickened.

Inflorescence. Inflorescence a panicle, exserted or embraced at base by subtending leaf. Peduncle pubescent above. Panicle open, oblong, 7–8 cm long. Primary panicle branches spreading, 1–2 -nate. Panicle branches scabrous, pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse or acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume apex acuminate to setaceously acuminate. Upper glume linear, 10 mm long, 2 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate to setaceously acuminate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-

branched, with 14–15 mm long limb, with twisted column. Column of lemma awn 3–4 mm long. Lateral lemma awns present, 9–11 mm long, shorter than principal. Palea hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 1.5 mm long. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia, Ecuador. Argentina Northwest.

Jujuy, Salta, Tucuman.

Illustrations (Journals): *Austr. Syst. Bot.* (5): 211, Fig.15 (1992).

Derivation (Clifford & Bostock 2007): L. of the south. From the south in general as from Africa, America, Europe or elsewhere.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–65 cm long, 3–4 -noded. Culm-internodes glaucous, smooth, distally glabrous. Lateral branches ample. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades flexuous, 5–10 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 8–24 cm long, 0.2–0.3 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, acute. Floret callus hairs 1.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or obscure. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1 mm long. Upper glume lanceolate, 13 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma lanceolate, subterete, 9–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 14–17 mm long limb, without a column, persistent. Lateral lemma awns present, 14–17 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia.

NW & Lake Eyre, Southern.

Aristida balansae Henrard. Fedde, *Repert.* 17: 397 (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Vietnam. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Balansa* s.n., 31 Oct 1886, Viet Nam: Bienhoa, Cu Due (L-908.83–940).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Benjamin Balansa (1825–1892) French botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms robust, 100–120 cm long. Lateral branches lacking or sparse. Ligule a fringe of hairs. Leaf-blades filiform, flat or involute, 25–60 cm long, 3–4 mm wide, coriaceous. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 45–55 cm long. Primary panicle branches appressed. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, bearded, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 0.75 length of upper glume, membranous, 1-keeled. Lower glume primary vein scaberulous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 10–12 mm long, 1 length of adjacent fertile lemma, membranous, with hyaline margins, 1-keeled. Upper glume surface asperulous. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 3 mm long.

Florets. Fertile lemma linear, subterete, 12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 20–40 mm long limb, with twisted column. Column of lemma awn 4–5 mm long. Lateral lemma awns present, 15–30 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Laos, Thailand, Vietnam.

Aristida barbicollis Trin. / Rupr. *Mem. Acad. Petersb. Ser. 6, 7:* 152. (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Ecklon s.n.*, South Africa: Cape: in saxosis siccis altit. II inter flumina Konabrivier et Katrivier in territorio "Ceded" LT designated by Henrard, *Meded. Rijks-Herb.* 54: 50 (1926).

Illustrations (Books): R.M.Phill, F.T.E.A., *Gramineae* (1(1970):158, Fig. 50), G.V.Pope et al., *Flora Zambesiaca* 10 (1(1971):130, t. 33), L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (Pl. 9), J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (as *A. congesta* subsp. *barbicollis*).

Derivation (Clifford & Bostock 2007): *L. barba*, beard; collum, neck. Orifice of leaf-sheath bears long hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 20–90 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheaths keeled. Leaf-sheath oral hairs lacking or bearded. Ligule a fringe of hairs. Leaf-blades curled, conduplicate or involute, 3–20 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–20 cm long, with spikelets clustered towards branch tips. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3–7 mm long, 0.4–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute, awned, 1 -awned, awn 0.8–2 mm long. Upper glume lanceolate, 7–11 mm long, 1.8–2.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma elliptic, subterete, 4–5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 12–28 mm long limb, with twisted

column, deciduous, abscising from top of column. Column of lemma awn 2–4 mm long. Lateral lemma awns present, 12–28 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa, Western Indian Ocean. DRC. Ethiopia (inc. Eritrea). Kenya, Tanzania. Mozambique, Zambia, Zimbabwe. Swaziland, Kwazulu-Natal, Northern Cape. Madagascar.

Aristida basiramea Vasey. *Coult. Bot. Gaz.* 9: 76. (1884).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: Warren Upham *s.n.*, Sep 1883, USA: Minnesota: Minneapolis (US-745517; ILT: L, US-745518, US-745515, US-990530). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 22(7): 533 (1924), but without specifying the specific sheets at US, but US-745517 was the only sheet annotated by Hitchcock for his 1924 revision of *Aristida*.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (329).

Derivation (Clifford & Bostock 2007): *L. basis*, base; *ramus*, branch. Culms much branched at the base.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–50 cm long. Culm-internodes smooth or scaberulous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat or involute, 7–15 cm long, 0.7–1.5 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle, terminal and axillary. Axillary inflorescences enclosed. Panicle open, linear, 5–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10–12 mm long, 0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume linear, 12–15 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, without keel, 3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, ascending or briefly coiled at base of limb, with 10–15 mm long limb. Lateral lemma awns present, spreading as much as principal, 5–10 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Eastern Canada, Northwest USA, North-central USA, Northeast USA, South-central USA, Southeastern USA. Ontario. Illinois, Iowa, Kansas, Minnesota, Missouri, Oklahoma, Wisconsin. Maine, New Hampshire. New Mexico, Texas.

Aristida batangensis Z. X. Tang & H. X. Liu. *J. Sichuan Univ., Nat. Sci. Ed.* 29 : 423 (1992).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Sichuan: Batang Xian, 2600–2700 m.,

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect or geniculately ascending, 50–70 cm long, 3–4 -noded. Leaf-sheaths loose, scaberulous. Ligule a fringe of hairs, 0.5–1 mm long. Leaf-blades straight or curved, involute, 3–15 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear. Primary panicle branches appressed. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 1.5–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse. Floret callus hairs 0.2–0.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex emarginate or obtuse. Upper glume lanceolate, 8.5–9 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or obtuse.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn straight, with 7 mm long limb, persistent. Lateral lemma awns present, 5–6 mm long, shorter than principal. Palea 7–8 mm long, 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Anthers 3, 3 mm long, yellow.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Sichuan.

Aristida behriana F. Muell. *Trans. Vict. Inst.* 1:44. (1855).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *F. Mueller s.n.*, Australia: South Australia: Murray River (K (photo, BRI); ILT: MEL). LT designated by Henrard, *Meded. Rijks-Herb.* 54: 52 (1926).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (320, Fig. 251), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (551, Fig. 109), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (126), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (101, Fig. 18), D.Sharp & B.K.Simon, *AusGrass*. Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Hans Hermann Behr (1818–1904), German-born, Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 22–43 cm long, 1 -noded. Culm-internodes antrorsely scabrous, distally glabrous. Lateral branches lacking. Leaf-sheaths scaberulous. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.3 mm long. Collar pubescent. Leaf-blades 10–25 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Peduncle terete. Panicle contracted, linear, 8–13.5 cm long. Primary panicle branches 0.4–0.8 cm long, bearing spikelets almost to the base. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15–19.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.7–1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–11.6 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 0.2–0.5 mm long. Upper glume lanceolate, 15–19 mm long, 1.6–2.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1–2.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, flat below, with 16–66 mm long limb, without a column, persistent. Lateral lemma awns present, 13–53 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.1–1.4 mm long. Caryopsis with adherent pericarp, 6.6–8 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., South Australia, Victoria. NW & Lake Eyre, Southern. Tablelands, Western Slopes, Western Plains.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): in honor of George Bentham (1800–1884) English botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 50–90 cm long, 2–3 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs, 0.3 mm long. Collar pubescent. Leaf-blades filiform or linear, flat or involute, 20–25 cm long, 3 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 14–30 cm long, 1–2 cm wide. Primary panicle branches 4–11.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.4 mm long, pubescent, acute. Floret callus hairs 0.2–1 mm long.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–9 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate, muticous or mucronate. Upper glume lanceolate, 5.5–9 mm long, 1.3–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous or scabrous. Upper glume apex emarginate or obtuse, muticous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 3.5–7 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness or scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 8–15 mm long limb, without a column, persistent. Lateral lemma awns present, 6–12 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 3–4 mm long. Hilum linear, 0.25 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Australia.** New South Wales, Queensland, Tasmania.

North, Central, South East, Inland. Coast, Tablelands, Western Slopes.

Derivation (Clifford & Bostock 2007): *L. bis*, twice; *glans*, acorn; *-ula*, diminutive; *-osa*, possession. There are two swellings at the pedicel bases.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms robust, 60–120 cm long, 3–4 -noded. Culm-internodes glaucous, smooth, distally glabrous. Leaf-sheaths smooth or antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs, 0.5 mm long. Collar pubescent. Leaf-blades 15–30 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20–30 cm long, 2–3 cm wide. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, obtuse.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–16 mm long, 1 length of upper glume, membranous, 1-keeled, 5 -veined. Lower glume apex acuminate or cuspidate. Upper glume lanceolate, 10–16 mm long, 1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume lateral veins absent or distinct. Upper glume apex emarginate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 11–12 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness or scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 22–36 mm long limb, without a column, persistent. Lateral lemma awns present, 17–31 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 7–8 mm long. Hilum linear, 0.25–0.33 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, South Australia. Central Australia. NW & Lake Eyre. North, Central, Inland.

Aristida bipartita (Nees) Trin.& Rupr. *Mem. Acad. Petersb.* 6, *Sci. Nat.* 5,1:144 (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Chaetaria bipartita* Nees, *Fl. Afr. Austr.* 1: 187 (1841). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Drhge s.n.* [3878], South Africa: Cape: Fort Beaufort distr.: near the Katrivier (B; IT; BM, G, G, K, OXF, P, PRE, SAM, W).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (307, Fig. 273).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. bis*, twice; *partia*, divide. Inflorescence branches regularly dividing into two.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 30–65 cm long, 1–3 -noded. Culm-internodes distally glabrous or pubescent. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades curled, conduplicate, 5–20 cm long, 1–2 mm wide, stiff. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–25 cm long, 6–13 cm wide, with spikelets clustered towards branch tips. Primary panicle branches spreading, 1 -nate, 2–10 cm long. Panicle branches glandular (in axils), scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4–0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.5–8 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex

acuminate, mucronate. Upper glume lanceolate, 6–7 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex emarginate or acute, mucronate.

Florets. Fertile lemma elliptic, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 7–14 mm long limb, persistent. Lateral lemma awns present, 7–14 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. **South Tropical Africa, Southern Africa.** Angola, Mozambique, Botswana (?), Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Free State, Kwazulu-Natal, Lesotho, Eastern Cape.

Aristida bissei Catasz. *Novosti Sist. Vyssh. Rast.* 20: 7 (1983).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Isla de la Juventud (Isla del Pinos): suelo calizo, 18 Oct 1975, L. Catasz. 859 (HT: HAC).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honour of Johannes Bisse (1935–1984) who collected in Cuba.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Caribbean.** Cuba.

Aristida blakei B.K. Simon. *Austrobaileya* 2(1): 88 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Queensland: Warrego Dist.: Morven, 2 Apr 1936, S.T. Blake 11000 (HT: BRI-254115; IT: AD, CANB, K, L, MEL, MO, NSW, NT, PERTH, PRE).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (127), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (115, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 216, Fig.16 (1992).

Derivation (Clifford & Bostock 2007): in honor of Stanley Thatcher Blake (1911–1973), Queensland botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–90 cm long, 3–5 -noded. Culm-internodes smooth, distally glabrous. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 11–20 cm long, 1–1.5 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–34 cm long, 4.5–7.5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.8–1 mm long, pubescent, acute. Floret callus hairs 1–1.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–14 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1 mm long. Upper glume lanceolate, 9–15 mm long, 1.1 length of

adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–12 mm long, coriaceous, pallid or light brown or purple, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 16–28 mm long limb, without a column, persistent. Lateral lemma awns present, 16–28 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia. Central Australia. North, Central, Inland. Western Slopes, Western Plains.

Aristida boninensis Ohwi & Tuyama. *Bot. Mag., Tokyo*, 51: 126. (1937).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bonin Is.: Kawate.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Bonin Islands, now known as Ogasawara-shot.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms 10–30 cm long, 0.3–0.6 mm diam., 1–2 -noded. Culm-internodes smooth. Leaves mostly basal. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades conduplicate, 5–12 cm long, 1–1.5 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 5–8 cm long, 2–4 cm wide. Primary panicle branches ascending, 1–2 -nate. Panicle axis smooth. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.3–1.5 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–9 mm long, 0.66 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 9–12 mm long, 1.5–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 40–60 mm long limb, with twisted column. Column of lemma awn 6–7 mm long. Lateral lemma awns present, 15–20 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Ogasawara-shoto.

Aristida brainii Melderis. *Bol. Soc. Brot., Ser. 2*, 44: 279 (1970).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Zimbabwe. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Victoria Falls: *Brain 8866* (K holo, SRGH).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of C. K. Brain (1930–42) who collected in Southern Rhodesia (now Zimbabwe).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 25–50 cm long, 3–4 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades 5–16 cm long, 1–1.7 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–20 cm long. Primary panicle branches 1–2 -nate, branching divaricately, bearing 1–3 fertile spikelets on each lower branch. Panicle branches glandular (in axils), scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–7.5 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, obtuse, mucronate. Upper glume lanceolate, 8.5–10 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma elliptic, subterete, 8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb, persistent. Lateral lemma awns present, 10–15 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Zimbabwe.

Aristida brasiliensis H.M. Longhi-Wagner. *Novon* 2(1): 36 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Minas Gerais: ca. 12 km from Barco de Cocais, base of Serra do Carac}7a, 28 Jan 1971, H. S. Irwin et al. 29325 (HT: SP; IT: MO, NY, UB)

Illustrations (Journals): *Novon* (2: 37, Fig. 1 (1992)).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 65–120 cm long. Lateral branches lacking. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 25–50 cm long, 2.5–3.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 16–23 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 15.5–20 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 23.5–28 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 9–10 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 47–59 mm long limb, with twisted column. Column of lemma awn 23–29 mm long. Lateral lemma awns present, ascending, 40–53 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast, Brazil South.

Minas Gerais, Sao Paulo. Santa Catarina.

Aristida brevissima L. Liou. *Fl. Xizangica* 5: 80 (1987).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Xizang: mountain slopes, 3000–3100 m, (HT: ?).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 635).

Derivation (Clifford & Bostock 2007): *L. brevis*, short; -issima, most. Leaf-blades very short?.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–40 cm long, 0.5–1 mm diam., 1–2 -noded. Culm-nodes glabrous. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades involute, 5 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10 cm long. Primary panicle branches 3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pilose, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume lanceolate, 12 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma elliptic, subterete, 10–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn straight, with 2 mm long limb, persistent. Lateral lemma awns present, 0.4 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, Tibet. Yunnan.

Aristida brevisubulata (Maire) Maire. *Bull. Soc. Hist. Nat. Afr. Nord* 2: 219 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Guinea. **Basionym or Replaced Name:** *Aristida longiflora* var. *brevisubulata* Maire, *Contr.* :2600 (1938).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. brevis*, short; *subula*, awl; -ata, possessing. Glumes or lemma shortly awned.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual or perennial, short-lived, caespitose, clumped loosely. Culms erect or geniculately ascending, 30–60 cm long. Culm-internodes distally glabrous. Culm-nodes purple, glabrous. Lateral branches ample. Leaf-sheaths loose or inflated, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades involute, 3–20 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches 2–3 -nate, indistinct the panicle almost racemose or simple, bearing 1–2 fertile spikelets on each lower branch. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, acute.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume linear, 20 mm long, 3.3 length of adjacent fertile lemma, membranous, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 50–55 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 12–25 mm long. Lateral lemma awns present, 50–55 mm long, subequal to principal. Palea 1.5 mm long, 0.25 length of lemma.

Flower and Fruit. Lodicules 2, oblong, 2 mm long, ciliate, hairy across the apex, truncate. Anthers 3, 3 mm long. Caryopsis with adherent pericarp, linear, 4 mm long. Embryo 0.25 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Algeria.

Aristida brittonorum Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 584 (1924).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *N.L. Britton, E.G. Britton & P. Wilson 14169*, 13 Feb 1916, Cuba: Isla de la Juventud: vicinity of Los Indios, white sand (US-907560; IT: CM, L (fragm.), NY-71004).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Nathaniel Lord and Elizabeth Gertrude Britton, United States botanists.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms erect, robust, 60–100 cm long. Ligule a fringe of hairs. Leaf-blades involute, 15–30 cm long, 1–2.5 mm wide, stiff.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 20–30 cm long. Primary panicle branches appressed, 2–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–10 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1 mm long, awned, 3 -awned. Principal lemma awn spreading, with 15–20 mm long limb. Lateral lemma awns present, spreading as much as principal or gyrate, 15–20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida burbidgeae B.K. Simon. *Austrobaileya* 2(1): 89 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Western Australia: Fortescue District: Mount Edgar, SE from Marble Bar. 11 Jun 1941, *N. T. Burbidge 1111* (HT: PERTH(photo, BRI); IT: PERTH).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (115, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 211, Fig.15 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Nancy Tyson Burbidge (1912–1977) Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms 20–45 cm long, 3-noded. Culm-internodes smooth, distally glabrous. Ligule a fringe of hairs, 0.4 mm long. Leaf-blades flexuous, 5–10 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 8–17 cm long, 0.5–1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.6 mm long, pubescent, acute. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 9 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous or scabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea, scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 13 mm long limb, without a column, persistent. Lateral lemma awns present, 11 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia.

Ereman. Darwin & Gulf.

Aristida burraensis B.K. Simon. *Austrobaileya* 2(1): 89 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Queensland: North Kennedy District: Burra Range, 25 km W of Pentland, July 1975, A. D. Chapman 1314 (HT: BRI-238092; IT: CANB, K, L).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (115, Fig. 20), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 211, Fig.15 (1992)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From the Burra Range, Queensland, Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40–80 cm long, 1–3 -noded. Culm-internodes scaberulous, distally glabrous. Leaf-sheaths scaberulous. Ligule a fringe of hairs, 0.4 mm long. Leaf-blades filiform, involute, 7–14 cm long, 1 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 16–28 cm long, 2 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6.6–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.6 mm long, pubescent, acute. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.6–8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 6.5–8 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn subterete below, with 10 mm long limb, without a column, persistent. Lateral lemma awns present, 10 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.
North, Inland.

Aristida calcicola Hitchcock & Ekman. *N. Am. Fl.* 17: 405 (1935).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman 15774*, 25 Nov 1922, Cuba: Oriente: Guantanamo, U.S. Naval Station, limestone terraces (US-1387435).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. calx*, lime; *-cola*, dweller. Growing on limestone.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, slender, 30–50 cm long, wiry, 2 -noded. Lateral branches lacking or sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades filiform or linear, flat or involute, 5–10 cm long, 0.5–1 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches appressed, bearing 1–3 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 8–9 mm long, 0.8–0.9 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 10 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 8–10 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 15–30 mm long limb. Lateral lemma awns present, gyrate, 15–30 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Dominican Republic.

Aristida californica Thurb. ex Wats. *Bot. Calif.* 2:289 (1880).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Recent Synonyms: *Aristida glabrata* (Vasey) Hitchcock, *Contrib. U. S. Nat. Herb.* 22: 522 (1924).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (322 as var. *californica* & *glabrata*).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From California, USA.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–30 cm long, wiry. Culm-internodes distally pubescent. Lateral branches ample. Ligule a fringe of hairs. Leaf-blades filiform, involute, 2–5 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 2–9 cm long, bearing few spikelets. Primary panicle branches indistinct the panicle almost racemose or simple. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 0.5 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 10–16 mm long, 2 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5–7 mm long, coriaceous, purple, without keel, 3 -veined, 0–3 -veined. Lemma surface asperulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 25–45 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 15–20 mm long. Lateral lemma awns present, spreading as much as principal, 25–45 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

$2n = 22$.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA, Mexico. California. Northwest Mexico. Baja California, Baja California Sur, Sonora.

Aristida calycina R. Br. *Prod.* 1: 173. (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Brown 6198*, 14 Aug 1802, Australia: Queensland: Port Curtis Dist.: Keppel Bay (K; IT: BM, BRI, E.). LT designated by Henrard, *Meded. Rijks Herb.* 54: 71 (1926).

Illustrations (Books): N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (551, Fig. 109), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (127), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(40) & 104(18) as *A. armata*), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (153, Fig. 23 as var. *calycina*), D.Sharp & B.K.Simon, *AusGrass*. Derivation (Clifford & Bostock 2007): Gk. *kalyx*, cup; *-ina*, belonging to.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped moderately or densely. Culms erect, 33–128 cm long. Culm-internodes mid-green or glaucous, smooth or scaberulous or papillose, distally glabrous. Lateral branches sparse. Leaf-sheaths smooth to antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.3–1 mm long. Collar glabrous or pubescent. Leaf-blades filiform or linear, involute, 20–25 cm long, 1–4 mm wide. Leaf-blade surface smooth or scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear to elliptic, 12–31 cm long, 2–20 cm wide. Primary panicle branches 2.5–6 cm long. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5.5–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–14.8 mm long, 0.75–1.1 length of upper glume, membranous, 1-keeled, 1–7 -veined. Lower glume lateral veins absent or distinct. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate, muticous or mucronate. Upper glume lanceolate, 5.5–20 mm long, 1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex emarginate to acuminate, muticous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–14 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness or scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 10–31 mm long limb, without a column, persistent. Lateral lemma awns present, 8–27 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 3–5 mm long. Hilum linear, 0.3–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland, Victoria, Western Australia.

Ereman. Darwin & Gulf. North, Central, South East, Inland. Coast, Tablelands, Western Slopes, Western Plains.

Aristida canescens Henrard. Meded. Herb. Leid. No. 54 A. 376 (1927).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Angola. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Angola, Huilla to Quihila Mission: Pearson 2634 (K holotype).

Illustrations: None found.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. canesco*, grow white. Leaf-blades or leaf-sheaths densely invested with white or grey hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long, 4 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades curled, 10–20 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins cartilaginous, scabrous.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, elliptic, interrupted, 10–20 cm long, with spikelets clustered towards branch tips. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–8 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex emarginate or obtuse, mucronate. Upper glume lanceolate, 8–11 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or truncate, mucronate.

Florets. Fertile lemma elliptic, subterete, 7–11 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 9–15 mm long limb,

persistent. Lateral lemma awns present, 7–13 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

$2n = 48$ (1 ref TRPOICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Zambia, Zimbabwe. Botswana, Limpopo, North-West, Gauteng, Mpumalanga, Free State, Kwazulu-Natal, Northern Cape, Eastern Cape.

Aristida capillacea Lam. *Illustr.* 1: 156. (1791).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from French Guiana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Richard s.n.*: Cayenne (P-LA; IT: C, G-Del, US-81033 (fragm. ex G-Del, P-LA)).

Illustrations (Books): R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983), S.A.Renvoize, *Gramineas de Bolivia* (1998) (276, Fig. 56), S.A.Renvoize, *The Grasses of Bahia*, 1984 (51, Fig. 17), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (32, Fig. 14), W.Burger, *Flora Costaricensis* 15, *Gramineae: Fieldiana Botany New Series* 4 (1980) (52, Fig. 12), G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 41, Fig. 7 (1997)), E.Judziwicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (67, Fig. 8).

Illustrations (Journals): *Ruizia* (13:233, Fig 26a-b (1993)).

Derivation (Clifford & Bostock 2007): *L. capillis*, a hair; *-acea*, indicating resemblance. inflorescence with capillary branches.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 11–24 cm long. Leaf-sheath oral hairs scanty or bearded (sparsely). Ligule a ciliate membrane, 0.2 mm long. Collar glabrous. Leaf-blades straight, conduplicate, 2.1–6 cm long, 0.8–0.9 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open (capilaceous branches), 6–10 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2 mm long, pilose, obtuse.

Glumes. Glumes dissimilar (lower shorter than upper). Lower glume lanceolate, 2.5–3.5 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acute or acuminate, muticous. Upper glume lanceolate, 3.2–3.9 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute or acuminate.

Florets. Fertile lemma subterete, 2–3.6 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 7–8 mm long limb, with twisted column. Column of lemma awn 1–2 mm long. Lateral lemma awns present, ascending, 6–7 mm long, subequal to principal.

Flower and Fruit. $2n = 22$.

Derivation (Clifford & Bostock 2007): *L. capillis*, hair; *folium*, leaf. Leaf-blades hair-like.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–80 cm long, 2 mm diam., 3 -noded. Culm-internodes smooth, distally glabrous. Lateral branches ample. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous. Leaf-sheath oral hairs pubescent, 0.3–0.4 mm long. Ligule a fringe of hairs, 0.3–0.5 mm long. Collar glabrous. Leaf-blades filiform, involute, 3–10 cm long, 0.5–1 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–25 cm long, 0.5–2 cm wide. Primary panicle branches 0.5–1 cm long. Panicle axis pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 3.5–8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.6–1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.6–8 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scabrous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 5.3–8.5 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scabrous. Upper glume lateral veins absent. Upper glume apex emarginate or obtuse, mucicous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 6.4–7.4 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn curved, spreading, flat below, with 8–16 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 8–14 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 4–5.8 mm long. Hilum linear, 0.5–0.7 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, South Australia, Western Australia. Kimberley. Central Australia. NW & Lake Eyre.

Derivation (Clifford & Bostock 2007): *L. caput*, head; Medusa, monster with snakes for hair. Inflorescence a spike-like panicle and the spikelets with long trifid, twisted awns.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 33–85 cm long. Culm-internodes smooth or scaberulous, distally glabrous. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking or ciliate, 0.5–2.5 mm long. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 2–4 cm long, 0.5–1 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate or ovate, 3.9–8 cm long, 1–5 cm wide. Primary panicle branches 4–8 cm long, bearing spikelets almost to the base. Panicle branches scaberulous or scabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–9.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.8–1.1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2.7–5 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex obtuse to acuminate. Upper glume lanceolate, 4–8 mm long, 0.66–0.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex obtuse to acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–9.5 mm long, coriaceous, pallid or light brown, concolorous or mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough generally. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, flat below, with 7–13 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 6–12 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.3 mm long. Caryopsis with adherent pericarp, 4–6.1 mm long. Hilum linear, 0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland.

North, Central, South East, Inland. Western Slopes, Western Plains.

Aristida chapadensis Trin. *Bull. Sc. Acad. Petersb.* 1: 68. (1836).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Riedel 1045*, May, Brazil: Serra da Chapada, in siccis arenosis (LE-TRIN-1268.02; IT: G, P, US-81004 (fragm. ex G, LE)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Serra da Chapada, Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 90–106 cm long. Lateral branches lacking. Leaf-sheath oral hairs scanty or bearded (sparsely). Ligule a ciliolate membrane, 0.2 mm long. Collar glabrous. Leaf-blades straight, flat or convolute (sometimes upper), 20–50(–60) cm long, 4–7 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 30–40 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1.5–1.8 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, (16–)17–19(–22) mm long, 1 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 14–16(–19) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 8–10 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above, with a median groove (ventral,longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (35–)45–56 mm long limb, with twisted column. Column of lemma awn (13–)16–25 mm long. Lateral lemma awns present, ascending, 28–46 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast, Brazil North. Mato Grosso. Bahia. Pará.

Aristida chaseae Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 575 (1924).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Puerto Rico. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *A. Chase 6507*, 12 Nov 1913, Puerto Rico: Boquersn, open, arid stony hill, culms few to tuft, widely spreading (US-732548; IT: L).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Mary Agnes Merrill Chase (1869–1963) United States agrostologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 50–60 cm long. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades involute, 10–15 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–15 cm long. Primary panicle branches appressed, 2–5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, pungent.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 10–13 mm long, 1 length of upper glume, membranous, 2 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate or setaceously acuminate. Upper glume linear, 10–13 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 11 mm long, coriaceous, light brown or purple, mottled with last colour, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 20 mm long limb. Lateral lemma awns present, spreading less than principal, 20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Puerto Rico.

Aristida chiclayensis Tovar. *Publ. Mus. Hist. Nat. "Javier Prado"*, Ser. B, Bot. 32: 11 (1984).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *R. Ferreyra 6047*, 2 May 1949, Peru: Lambayeque: Chiclayo Prov.: cerca a Chiclayo, 150–200 m, arenoso (US-2014561).

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 10–15 cm long. Lateral branches ample, arising from lower culm. Leaf-sheaths 1–2 cm long. Ligule a fringe of hairs. Leaf-blades filiform, involute, 2–4 cm long, 1 mm wide. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 3–4 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 14–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 8–10 mm long, 0.66 length of upper glume, membranous. Lower glume apex acute. Upper glume linear, 14–15 mm long, 3–4 length of adjacent fertile lemma, membranous. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma linear, subterete, 3.5–4.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 27–40 mm long limb, with twisted column, limb scabrous. Column of lemma awn 4.5–6 mm long. Lateral lemma awns present, subequal to principal. Palea 1.3 mm long, 0.33 length of lemma.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

Aristida chinensis Munro. *Proc. Am. Acad.* 4: 363. (1860).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Wright s.n.*, 1853–1856, China: Kwantung: Huang-pu (Whampoa) and Cum-sing-moon near Hong Kong (K; IT: US-99208).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From China.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms decumbent, 30–60 cm long. Leaves mostly basal. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades curved, involute, 10–15 cm long, 0.5–1 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 15–30 cm long. Primary panicle branches 1–2 -nate, 6–8 cm long. Panicle branches bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.7 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–11 mm long, 1.2–1.3 length of upper glume, membranous, 1-keeled. Lower glume primary vein scaberulous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 8–9 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 7.5–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 15–20 mm long limb, without a column. Lateral lemma awns present, 10–15 mm long, shorter than principal, lemm awns 0.66 length of principal.

Flower and Fruit. Anthers 3.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. related. Similar to another species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 20–40 cm long. Lateral branches sparse, arising from lower culm. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs. Leaf-blades involute, 5–15 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–15 cm long. Primary panicle branches ascending, 1–2 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 4–5 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 5–7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6–7 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1 mm long, awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb. Lateral lemma awns present, spreading less than principal, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Northern South America. Leeward Is, Windward Islands. Venezuela.

Aristida condensata Chapm. *Coult. Bot. Gaz.* 3: 19. (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: A.W. Chapman s.n., no date, USA: Florida: Apalachicola (L (fragm. ex US), US-80996).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (341).

Derivation (Clifford & Bostock 2007): *L. condense*, press close together. Spikelets crowded in the inflorescence.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–150 cm long. Leaf-sheaths glabrous on surface or pilose. Ligule a fringe of hairs. Leaf-blades flat, 15–30 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, dense, 15–30 cm long. Primary panicle branches ascending, 5–10 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, pungent.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 8–9 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate or setaceously acuminate. Upper glume linear, 8–9 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 8 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1 mm long, awned, 3 -awned. Principal lemma awn 3-branched, ascending or spreading, with 10–15 mm long limb. Lateral lemma awns present, spreading as much as principal or gyrate, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina.

Aristida condylifolia Caro. *Darwiniana* 14 :391 (1967).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Prov. Entre Rios, dpto. Feliciano, Paso Yunque, peladares, A. Burkart, N.S. Troncoso, N.M. Bacigalupo & S. Crespo 25248 (HT: SI).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (31), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (218, Fig. 81).

Derivation (Clifford & Bostock 2007): Gk. *kondylus*, knuckle; L. *folium*, leaf. Leaf-blade abruptly bent at the junction with sheath.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 20–40(–50) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curved or straight, conduplicate, 6–16 cm long, 0.2–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 12–18 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.5–0.8 mm long, pilose, obtuse or acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 9–12(–15) mm long, 1–3 -veined (lateral veins free). Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acuminate (shortly awned), muticous or mucronate. Upper glume lanceolate, 18–28 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acuminate (shortly awned).

Florets. Fertile lemma laterally compressed or subterete, 10–13(–15) mm long, without keel, rounded except near apex, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface scaberulous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 50–80 mm long limb, without a column. Lateral lemma awns present, ascending, 50–80 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Argentina Northeast, Paraguay. Entre Rios.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. crowded together. Spikelets crowded in inflorescence.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–75 cm long. Culm-internodes distally glabrous. Leaf-sheath oral hairs lacking or bearded. Ligule a fringe of hairs. Leaf-blades conduplicate or convolute, 2–20 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 3–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6.5–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, truncate.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–5 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute, awned, 1 -awned, awn 2 mm long. Upper glume lanceolate, 6.5–10 mm long, 1.6–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume awned, 1 -awned, awn 2 mm long.

Florets. Fertile lemma lanceolate, subterete, 4–5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 12–30 mm long limb, with twisted column, deciduous, abscising from top of column, limb scabrous. Column of lemma awn 2–4 mm long. Lateral lemma awns present, 12–30 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

$2n = 22$, or 44.

Distribution (TDWG). Continent. Europe (*), Africa, Temperate Asia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Northern Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa, Middle Atlantic Ocean, Western Indian Ocean.** Algeria, Morocco, Tunisia. Eritrea, Ethiopia (inc. Eritrea). Kenya, Tanzania. Angola, Mozambique, Zambia, Zimbabwe. Aristida constricta H.M. Longhi-Wagner. *Novon* 2(1): 39 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Longhi-Wagner et al. 1562, 17 Nov. 1987, Brazil: Rio Grande do Sul: Santana do Livramento, Cerro Palomas (ICN; IT: MO-3801206).

Illustrations (Journals): *Novon* (2: 38, Fig. 2 (1992)).

Derivation (Clifford & Bostock 2007): *L. constringo*, bind together. Lemma constricted at the summit.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 24–26 cm long. Lateral branches lacking. Leaf-sheath oral hairs sparsely bearded. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 10–33 cm long, 2–3.5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 10–15 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1–1.3 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 16–19.5 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex setaceously acuminate, awned. Upper glume lanceolate, 13–15 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 7–9 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, pseudo-articulate at base (of column), with 32–40 mm long limb, with twisted column. Column of lemma awn 10–15 mm long. Lateral lemma awns present, ascending, 26–32 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Paraguay. Rio Grande do Sul.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. twisted. Awns hygroscopic and so twisted when dry.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual or perennial, short-lived, caespitose. Culms erect or geniculately ascending, zigzag, 12–44 cm long, 2–4 -noded. Culm-internodes antrorsely scabrous, distally glabrous. Lateral branches ample. Leaf-sheaths smooth or scaberulous, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate, 3 mm long. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades flexuous, filiform, involute, 3–10 cm long, 1 mm wide. Leaf-blade surface smooth or scaberulous, glabrous or pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 9–26 cm long, 4–9 cm wide. Primary panicle branches 2–3 -nate, 1–2.5 cm long. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, compressed slightly, 12–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–2 mm long, pubescent, pungent. Floret callus hairs 0.1–0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7.4–14.2 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 12–30 mm long, 2.5–4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous or scabrous. Upper glume apex emarginate or acute or acuminate, muticous.

Florets. Fertile lemma lanceolate, laterally compressed, 4.9–7 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 18–95 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 7–26 mm long. Lateral lemma awns present, spreading as much as principal, 16–92 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.3 mm long. Caryopsis with adherent pericarp, 3–4.5 mm long. Hilum linear, 0.5–0.6 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Australia.** New South Wales, Northern Territory, Queensland, South Australia, Victoria, Western Australia.

TYPE from West Indies: Turks & Caicos Islands.: T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Caicos Island, 21.31N 71.30W, near sea level WSW of the South Caicos airport terminal building, 12 Dec 1988, Proctor 45260 (HT: LSU; IT: SJ).

Illustrations (Journals): *Systematic Botany* (15: 42, Fig.1 (1990)).

Derivation (Clifford & Bostock 2007): in honor of Helen Correll (fl.1990) United States botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 8–10 -noded. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs bearded, 4 mm long. Ligule a fringe of hairs, 0.2–0.4 mm long. Leaf-blades erect, curved, plicate, 10–22 cm long, 0.4–1 mm wide. Leaf-blade surface woolly, hairy abaxially (proximally). Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, comprising 2–20 fertile spikelets. Panicle open, linear, 3–20 cm long, bearing few spikelets. Primary panicle branches appressed, indistinct the panicle almost racemose, bearing 2–3 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–8.5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7.4–9.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.7–0.9 mm long, pubescent, acute.

Glumes. Glumes similar, with lower wider than upper, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 5–9 mm long, 0.7–0.9 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 7.4–9.7 mm long, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 7.5–10 mm long limb. Lateral lemma awns present, 7.5–10 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Turks-Caicos Is.

Aristida culionensis Pilger ex Perkins. *Frag. Fl. Philipp.* 1: 145. (1904).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

Rijks-Herb. 54: 120 (1926).

Illustrations: None found.

Images: H.B.Gilliland et al., *Flora of Malaya Vol. 3 Grasses* (1971);.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Culisn Island, Philippines.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 80–120 cm long. Leaf-sheaths 9–20 cm long. Ligule a fringe of hairs. Leaf-blades 35–50 cm long, 6 mm wide. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 30–40 cm long. Primary panicle branches ascending or spreading, whorled at most nodes, 8–15 cm long. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9 mm long, 0.9 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 1–2.5 mm long. Upper glume lanceolate, 10–11 mm long, 1–1.2 length of adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2.5 mm long.

Florets. Fertile lemma elliptic, subterete, 10–13 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 39 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 3 mm long. Lateral lemma awns present, 33 mm long, subequal to principal or shorter than principal. Palea 1.3 mm long, 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3, 4 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China, Malesia. Thailand, Vietnam. Malaya, Philippines.

Derivation (Clifford & Bostock 2007): in honor of Hugh Cuming (1791–1865) English naturalist and traveller.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms 8–30 cm long. Culm-internodes distally glabrous. Leaves cauline. Ligule a fringe of hairs. Leaf-blades 2–7 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 3–8 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 2–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1.5–2 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 2–2.5 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma elliptic, subterete, 1.5–1.7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 4.5–6 mm long limb, persistent. Lateral lemma awns present, 2.5–4 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Aristida curtissii (Gray) Nash. Britton, *Man. Fl. N. U.S.* 94. (1901).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from USA. **Basionym or Replaced Name:** *Aristida dichotoma* var. *curtissii* Gray, *Man.* ed. 6:640 (1890). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: A.H. Curtiss s.n., 8 Oct 1871, USA: Virginia: Bedford Co. (GH; ILT: US-745544 (right-hand specimen), US-81057 (fragm. ex GH & photo)). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 22(7): 535 (1924).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Allen Hiram Curtiss (1845–1907) United States botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 30–40 cm long. Culm-internodes scaberulous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat or involute, 4–10 cm long, 0.5–1 mm wide. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle, terminal or terminal and axillary. Panicle contracted, linear, 5–10 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets solitary. Fertile spikelets sessile and pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 5–7 mm long, 0.5–0.66 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume linear, 10 mm long, 1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading or briefly coiled at base of limb, with 10 mm long limb. Lateral lemma awns present, spreading less than principal, 2–4 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, North-central USA, Northeast USA, Southeastern USA. Colorado, Wyoming. Illinois, Iowa, Kansas, Missouri, Nebraska, Oklahoma, South Dakota, Wisconsin. Arkansas, Florida, Kentucky, Maryland, Virginia.

Aristida curvifolia Fourn. *Mex. Pl.* 2:78 (1886).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Virlet d'Aoust 1449*, 1851, Mexico: San Luis Potosm (P; ILT: US-81602 (fragm. ex P & photo)). LT designated by Davila & Sanchez-Ken, *Fl. Valle Tehuacan-Cuicatlan* 3: 12 (1994).

IST: *W.F. Karwinski von Karwin 1007*, Jul 1842, Mexico: inter La Noria del Viejo et Tanquecillos (LE, US-80991 (fragm. ex LE & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. curvus*, bent; *folium*, leaf. The leaf-blades are convolute.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–40 cm long, wiry. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Collar glabrous. Leaf-blades curved or flexuous, involute, 5–20 cm long, 1 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, pungent.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex emarginate or obtuse, mucronate. Upper glume lanceolate, 10–11 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex emarginate or obtuse, mucronate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex scabrous, awned, 3 -awned. Principal lemma awn

spreading, with 10–15 mm long limb. Lateral lemma awns present, spreading as much as principal, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

$2n = 22$ (1 ref TROPICOS), or 44 (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Southeast Mexico. Puebla. Coahuila, Durango, Neuvo Leon, San Luis Potosi, Zacatecas. Chiapas.

Aristida cyanantha Steud. *Syn. Pl. Gram.* 141. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Nepal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *Royle 64*, Nepal (LE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *kyanos*, blue; *anthos*, flower. Spikelets glaucous.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 100–200 cm long. Ligule a fringe of hairs. Leaf-blades flat or involute, 15–35 cm long, 3–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 20–40 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.7–1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–12 mm long, 0.75–0.8 length of upper glume, scarious, purple, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned. Upper glume lanceolate, 10–15 mm long, 1.2–1.5 length of adjacent fertile lemma, scarious, purple, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 3–5 mm long.

Florets. Fertile lemma elliptic, subterete, 8–10 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 35–55 mm long limb, persistent. Lateral lemma awns present, 25–45 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. Western Asia. Indian Subcontinent. India, Pakistan, West Himalaya. Uttah Pradesh. Jammu Kashmir.

Aristida dasydesmis Mez. *Fedde, Repert.* 17: 148 (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Drhge*, South Africa: Kapgebiet (B). LT: *Schlechter 11228*, Sep 1897, South Africa: Cape: Little Namaqualand distr.: auf Hgeln bei Iaus (B; ILT: GRA, K, PRE). LT designated by Henrard, *Meded. Rijks-Herb.* 54: 131 (1926).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *dasy*, hairy; *desmos*, mooring cable. Callus hairy.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 35–70 cm long, 1.5–3 mm diam. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches fastigiate. Leaves cauline. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades erect, aciculate, conduplicate, 15–30 cm long, 1 mm wide, stiff. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 5–10 cm long, 3–6 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pilose, truncate or obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Upper glume lanceolate, 8 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent.

Florets. Fertile lemma elliptic, subterete, 8 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 25 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 5 mm long. Lateral lemma awns present, 20 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Northern Cape, Western Cape.

Aristida decaryana A. Camus. *Bull. Soc. Bot. France* 105: 246 (1958).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar, Ankazobe: *Decary 14084* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Raymond Decary (1891–1973) French botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, slender, 15–20 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths striately veined, glabrous on surface. Ligule a fringe of hairs. Leaf-blades curved, filiform or linear, convolute, 2–7 cm long. Leaf-blade surface smooth, glabrous.

Inflorescence. Inflorescence a panicle, comprising 4–6 fertile spikelets. Panicle open, lanceolate, 3–6 cm long, bearing few spikelets. Primary panicle branches appressed, 0.8–0.9 cm long, bearing 1–2 fertile spikelets on each lower branch. Panicle branches glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, subterete, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 2.5–3 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 3.5–4.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 3.5–4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 1 -awned. Principal lemma awn curved, with 20 mm long limb.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Aristida denudata Pilger. R. E. Fries, *Wiss. Ergebn. Schwed. Rhod.-Kongo-Exped* ,1911–12, i. 206 (1916).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zambia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Anon.* 887, 5 Oct, Nordost-Rhodesia: Bangweolo bei Kamindas, auf ziemlich feuchter Wiese (S). ST: *Anon.*

1161, 30 Oct, Am Kalungwisi-river, zwischen dem Bangweolo- und Tanganyika-See, auf feuchter Wiese (S).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. lacking in hairs. Foliage of spikelets glabrous or weakly hairy.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long, 1–2 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades 10 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 5–12 cm long. Primary panicle branches 2 -nate, 3–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, bearded, truncate or obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–8.5 mm long, 0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 10–11 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 6.5–7.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above or in lines. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, reflexed, with 30–35 mm long limb, persistent. Lateral lemma awns present, spreading less than principal, 25–30 mm long, shorter than principal. Palea 0.3 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Malawi, Zambia, Zimbabwe.

Aristida depressa Retz. Obs. 4: 22 (1786).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Kvning s.n.*, India; in sterilioribus Malabaricae (S; IT: B-W, M).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. broad and dwarf the growth having taken place horizontally. With spreading geniculate culms.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Western Indian Ocean. Mauritius (*), Seychelles. **China.** China South Central. **Indian Subcontinent, Indo-China.** India, Sri Lanka. Myanmar, Thailand. Sichuan, Yunnan. Kerala. Tamilnadu.

Aristida desmantha Trin. & Rupr. *Mem. Acad. Petersb. Ser. 6, 7:* 109. (1842).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Drummond* 285, no date, USA: Texas (LE; IT: US-81059 (fragm. ex E, LE), W-15636).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (320), F.W.Gould, *The Grasses of Texas* (1975) (388, Fig. 205).

Derivation (Clifford & Bostock 2007): Gk. *desmos*, anything used for tying; anthos, flower. The three arms of the awn intertwine at maturity.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 45–100 cm long, wiry. Lateral branches ample. Leaf-sheaths without keel, glabrous on surface or pubescent or pilose or woolly. Ligule a fringe of hairs, 0.2–0.3 mm long. Leaf-blades flat or involute, 25–40 cm long, 2–4.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 8–20 cm long. Primary panicle branches ascending. Panicle branches stiff, scabrous. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–13 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume surface glabrous or hispid. Lower glume apex acute, awned, 1 -awned, awn 2–4 mm long. Upper glume lanceolate, 10–13 mm long, 1.3–1.4 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume surface glabrous or hispid. Upper glume apex acute, awned, 1 -awned, awn 2–4 mm long.

Florets. Fertile lemma linear, laterally compressed, 7–10 mm long, coriaceous, yellow or purple, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, recurved at base of limb, with 20–35 mm long limb, with a straight or slightly twisted column, deciduous, abscising from top of lemma. Column of lemma awn 1–2 mm long. Lateral lemma awns present, gyrate, 20–35 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, South-central USA, Southeastern USA. Illinois, Kansas, Oklahoma. Texas. Louisiana.

Aristida dewinteri Giess. *Bothalia* 10(2): 365 (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Kaokoveld, Enyandi: *Giess 9345* (PRE holo, K, M, WIND, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Bernard de Winter (1924-) South African botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 50–100 cm long, 2–3 -noded. Culm-internodes distally glabrous. Culm-nodes purple. Lateral branches lacking. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades flat or involute, 15–30 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 15–30 cm long, 10–15 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 3.5–4 mm long, 0.3–0.4 length of upper glume, membranous, yellow or black (at tip), 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 10–11 mm long, 1.5 length of adjacent fertile lemma, membranous, yellow or black (at tip), 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 7–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 1.3–1.4 mm long. Lateral lemma awns present, 25 mm long, shorter than principal. Palea oblong, 0.7 mm long, 0.1 length of lemma, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules 2, ovate, 1–1.25 mm long, veined, obtuse. Anthers 3, 3 mm long, yellow. Caryopsis with adherent pericarp, linear, 3–3.5 mm long. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Angola. Namibia.

Aristida dichotoma Michx. *Fl. Bor. Am.* 1: 41. (1803).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Michaux s.n.*, USA: South Carolina: in Carolina septentrionali juxta Lincoln (P; IT: C, P, US-81058 (fragm. ex P)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (329 as var. *dichotoma* & *curtissii*), F.W.Gould, *The Grasses of Texas* (1975) (389, Fig. 206 as var. *dichotoma*).

Derivation (Clifford & Bostock 2007): L. with divisions in pairs. Culms branching dichotomously.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms zigzag, 15–75 cm long, wiry. Lateral branches ample, arising from mid culm or upper culm. Leaf-sheaths without keel, glabrous on surface. Ligule a fringe of hairs, 0.2–0.3 mm long. Leaf-blades filiform, 8–15 cm long, 1–2 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–15 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–10 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute or setaceously acuminate. Upper glume lanceolate, 4–10 mm long, 1–1.6 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 4–6 mm long, coriaceous, yellow or purple, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading or briefly coiled at base of limb, with 5–9 mm long limb, without a column. Lateral lemma awns present, spreading less than principal, 1–2 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Eastern Canada, North-central USA, Northeast USA, South-central USA, Southeastern USA. Ontario. Illinois, Iowa, Kansas, Minnesota, Missouri, North Dakota, Nebraska, Oklahoma, South Dakota, Wisconsin. Connecticut, Indiana, Maine, Massachusetts, Michigan, Ohio, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, West Virginia. New Mexico, Texas. Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia, District of Columbia.

Aristida diffusa Trin. *Bull. Sc. Acad. Petersb.* 1: 68 (1830).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: South Africa, Cape: Coll? (LE holo).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (Plt. 8I as var. *burkei*).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. widely spreading. Inflorescence an open panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous or woolly. Culms erect, 40–75 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades curled, filiform, involute, 10–30 cm long, 2.5–3 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle, shorter than basal leaves. Panicle open, elliptic, effuse, 15–30 cm long. Primary panicle branches spreading, distant, 2–3-nate, 10–15 cm long. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–9 mm long, 0.4–0.5 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 10–17 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume apex emarginate.

Florets. Fertile lemma elliptic, subterete, 9–13 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface smooth or asperulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 20–30 mm long limb, with a straight or slightly twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 2–6 mm long. Lateral lemma awns present, 20–30 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Zimbabwe. Limpopo, North-West, Gauteng, Mpumalanga, Free State, Kwazulu-Natal, Lesotho, Northern Cape, Western Cape, Eastern Cape.

Aristida diminuta (Mez) C. E. Hubbard. *Kew Bull.* 1949, 480 (1949).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Malawi. **Basionym or Replaced Name:** *Stipa diminuta* Mez, Fedde, *Repert.* 27: 208 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. Buchanan 561*, no date, Malawi (B; IT: K, US-866121 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *diminuo*, make less. Awn apparently single due to non development of the lateral arms.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 15–30 cm long. Culm-internodes distally glabrous. Leaves cauline. Ligule a fringe of hairs. Leaf-blades 2–7 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, loose or effuse, 4–10 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 2.5–3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 2–2.5 mm long, 0.8 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute, muticous or mucronate. Upper glume lanceolate, 2.5–3 mm long, 1.7–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume apex acute, muticous or mucronate.

Florets. Fertile lemma elliptic, subterete, 1.5–1.7 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1-awned. Principal lemma awn curved, 7–10 mm long overall. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Lodicules 2. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Mali. Burundi, DRC. Chad. Tanzania. Malawi, Mozambique, Zambia, Zimbabwe.

Aristida divaricata Jacq., non Willd.(1809). *Eclog.* 7. t. 6 (1813).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Aristida humboldtiana* Trin. & Rupr., nom superfl, *Mem. Acad. Petersb. Ser.6* (7) 118. (1849). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Humboldt & Bonpland 4207*, Mexico: Guanajuato (B-W; IT: P-Bonpl, P, US-81054 (fragm. ex P-Bonpl. & photo), US-81055 (fragm. ex P)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (325).

Derivation (Clifford & Bostock 2007): *L. divarico*, spread out. Inflorescence branches or culms regularly dividing into equal branches.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 25–70 cm long, wiry. Leaf-sheaths without keel. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs, 0.5–1 mm long. Leaf-blades conduplicate, 6–20 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, effuse, 10–30 cm long, 0.5 of culm length. Primary panicle branches spreading. Panicle branches with insignificant pulvini. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 8–13 mm long, 1.6–1.8 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb, with twisted column. Column of lemma awn 2–5 mm long. Lateral lemma awns present, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

$2n = 22$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Northwest USA, North-central USA, Southwestern USA, South-central USA, Mexico. Colorado. Kansas, Oklahoma. Arizona, California. New Mexico, Texas. Central Mexico, Northeast Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico. **Mesoamerica, Southern South America.** Guatemala, Honduras. Paraguay.

Tucuman. Distrito Federal, Mexico State, Puebla, Tlaxcala. Aguascalientes, Coahuila, Chihuahua, Durango, Guanajuato, Hidalgo, Neuvo Leon, Queretaro, San Luis Potosi, Tamaulipas, Zacatecas. Veracruz. Baja California, Sonora. Jalisco, Michoacan, Nayarit, Oaxaca.

Aristida divulsa Andersson. *Galapagos Veg.* 143. 1854.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Galapagos. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *N.J. Andersson 39*, 1863, Galapagos Islands: Chatham Island (S; IT: C, GOET, P, US-81053 (fragm. ex C, GOET, P, S & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. divello*, tear apart. Panicles or racemes interrupted.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–80 cm long, 3–4 -noded. Culm-internodes terete, smooth or scaberulous. Culm-nodes swollen. Lateral branches lacking or sparse, arising from mid culm. Leaf-sheaths mostly shorter than adjacent culm internode, smooth or scaberulous, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat or convolute, 10–30 cm long, 1–2.5 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 15–20 cm long, contracted about primary branches. Primary panicle branches 1 -nate, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume lanceolate, 6 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma oblong, subterete, 3 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 12 mm long limb, with twisted column, deciduous, abscising from top of column. Column of lemma awn 1.5–3 mm long. Lateral lemma awns present, 12 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Galapagos.

Aristida dominii B.K. Simon. *Austrobaileya* 2(3): 281 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Queensland: Cook District: 7 km N of North Kennedy R., 28 Apr. 1983, *J. R. Clarkson 4801* (HT: BRI; IT: AD, CANB, DNA, K, MEL, MO, NSW, PERTH, QRS).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 155, Fig.2 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Karel Domin (1882–1953) Czech educator and botanist who collected widely in Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 13–50 cm long. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 3 mm long. Ligule a fringe of hairs, 0.3–1 mm long. Leaf-blades flexuous, filiform, involute, 8–16 cm long, 0.5 mm wide. Leaf-blade surface scaberulous or scabrous, rough abaxially, glabrous or pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, 12–17 cm long, 1.2 cm wide. Primary panicle branches 2 -nate, 2–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, compressed slightly, 17–21 mm

long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, pungent. Floret callus hairs 0.2–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–10 mm long, 0.4–0.5 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface smooth to scabrous. Lower glume apex emarginate or obtuse, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 17–21 mm long, 2.3–3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or obtuse, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, laterally compressed, 5.1–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 38–64 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 10–23 mm long, pubescent. Lateral lemma awns present, 20–41 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 4.5–5.5 mm long. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia. Kimberley. Darwin & Gulf. North.

Aristida echinata Henrard. *Meded. Herb. Leid.* No. 30 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *W. McComb s.n.*, Apr. 1918, Queensland: Warrego Distr.; Morven (K (photo, BRI); IT: BRI). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 714 (1933).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (128), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(29)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 197, Fig.11 (1992).

Derivation (Clifford & Bostock 2007): L. spiny. Inflorescence a very condensed panicle and the spikelets or axillary structures are awned the whole thereby resemble a hedgehog.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 50–120 cm long. Culm-internodes smooth, distally glabrous. Lateral branches ample. Leaf-sheaths antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs, 0.5 mm long. Collar glabrous or pubescent. Leaf-blades involute, 6–12 cm long, 1–2.5 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–10 cm long, 0.8–2 cm wide. Primary panicle branches 0.5–1.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6.3–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–10 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 4–10 mm long, 0.6–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 6.3–10 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 11–19 mm long limb, without a column, persistent. Lateral lemma awns present, 11–19 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 5–8 mm long. Hilum linear, 0.3 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland.
Central, South East, Inland. Coast, Western Slopes, Western Plains.

Aristida echinulata Roseng. & Izag. de Artucio. *Bol. Univ. Republ. Fac. Agron. Montevideo*, No. 94, 3 (1967).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Rosengurt B-7931*, 2 Jan 1960, Tacuarembos: Chamberlain, ruta 5 (MVFA; IT: BLA, K, US-2946508).

Illustrations (Books): B.Rosengurt, *Gramineas Uruguayas I* (1970) (208, Fig. 85).

Derivation (Clifford & Bostock 2007): *L. echinus*, hedgehog; -ulus, diminutive; -ata, possessing. Leaf-blades hispid with small prickles.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 23–25 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2–0.4 mm long. Collar glabrous. Leaf-blades curved, conduplicate, 3.5–13 cm long, 1.3–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (subcontracted), 10–15 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, pilose, acute.

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 11–15 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex acute. Upper glume lanceolate, 19–25 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute, mucronate.

Florets. Fertile lemma subterete, 12–14 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface papillose or tuberculate (strongly), rough generally or above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 55–80 mm long limb, without a column. Lateral lemma awns present, ascending, 50–72 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Uruguay.
Rio Grande do Sul.

Aristida ecuadoriensis Henrard. *Meded. Herb. Leid.* No. 58 A. 307 (1932).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.S. Hitchcock 20761*, 27 Jul 1923, Ecuador: Huigra, Chimborazo, 1200 m, along old railway grade (L; IT: NY-74320, US-1163812).

Illustrations (Books): G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 45, Fig. 8 (1997)).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Ecuador.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–70 cm long. Ligule a fringe of hairs. Leaf-blades 10–20 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–20 cm long. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 5–5.5 mm long, 0.75 length of upper glume, membranous. Lower glume apex acute. Upper glume linear, 6–7 mm long, 1–1.1 length of adjacent fertile lemma, membranous. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 8–11 mm long limb. Lateral lemma awns present, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia, Ecuador, Peru.

Aristida effusa Henrard. *Meded. Herb. Leid.* No. 54, 155 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: A. Engler 6162, Apr 1938, Namibia: Karibib (B).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Derivation (Clifford & Bostock 2007): L. spread out. Inflorescence an open panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, slender, 45–90 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches ample. Ligule a fringe of hairs. Leaf-blades flat, 15–30 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 20–30 cm long, 15 cm wide, with spikelets clustered towards branch tips. Primary panicle branches spreading. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 6–8.5 mm long, 0.66–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous, rough above. Lower glume apex acute or acuminate. Upper glume lanceolate, 5.5–8 mm long, 0.66 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex truncate or obtuse.

Florets. Fertile lemma linear, subterete, 9–11.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 16 mm long limb, persistent. Lateral lemma awns present, 13 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Namibia, Botswana, Limpopo, North-West, Gauteng.

Aristida eggersii Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 56 (1924).

TYPE from Cuba. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *H.F.A. von Eggers* 5389, May 1889, Cuba: in calcaritis, ad mare, La Caimanera (US-820940).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Heinrich Franz Alexander Eggers (1844–1908) German-born Danish military officer and plant collector in the West Indies and South America.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending or decumbent, 20–40 cm long, wiry. Leaf-sheaths smooth or scaberulous, glabrous on surface. Ligule a fringe of hairs. Collar pilose. Leaf-blades curved or flexuous, filiform, involute, 5–10 cm long, 0.5 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 3–10 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 5–6 mm long, 0.5 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume linear, 10–12 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 20–25 mm long limb. Lateral lemma awns present, spreading less than principal, 20–25 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Dominican Republic.

Aristida ekmaniana Henrard. *Meded. Herb. Leid.* No. 54, 159 (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *P. Dusin 9710*, 16 Apr 1910, Brazil: Parana: in alto planitie Jaguariahya, in campo (L-923.213–114; IT: K, NY-39634, US-601164).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Erik Leonard Eckman (1888–1931) Swedish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms (58–)70–85(–115) cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded. Ligule a ciliolate membrane, 0.2 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or conduplicate (upper), (7–)11–34 cm long, 1.8–3.6 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, hairless except near base, moderately hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 15–33 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.8 mm long or -1.2 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower longer, shorter or subequal upper). Lower glume lanceolate, 9.8–14.2 mm long, 1 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 8.5–14 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire or dentate, 2 -fid, setaceously acuminate.

Florets. Fertile lemma subterete, 6–7 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (14–)15–22(–30) mm long limb, with twisted column. Column of lemma awn (5–)8–12 mm long. Lateral lemma awns present, ascending, 13–20(–25) mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South.

Sao Paulo Parana. Distrito Federal, Mato Grosso. Bahia. Minas Gerais, Sao Paulo. Paraná.

Aristida elliptica (Nees) Kunth. *Enum. Pl.* 1: 193. (1833).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Chaetaria elliptica* Nees, *Agrost. Bras.* 389 (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Martius s.n.*, Brazil: provinciae Maragnanensis: in fluvii Itapicuru ripa ad Cachias (LE-TRIN-1282.01 (fragm. misit Nees ab Esenb. 1830), M). LT: *K.F.P. von Martius s.n.*, May, Brazil: Piauhm: habitat in pascuis agrestibus provinciae Piauhianae (M; ILT: K (photo ex M), US-865701 (fragm. ex M & photo)). LT designated by Henrard, *Meded. Rijks-Herb.* 54: 166 (1926); also cited by Longhi-Wagner, *Bol. Inst. Bot. (Sao Paulo)* 12: 130 (1999).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (55, Fig. 19).

Derivation (Clifford & Bostock 2007): Gk. *elluipsis*, ellipse; -ike, belonging to. Culms semiterete.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 20–25(–50) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.6–0.8 mm long. Collar glabrous. Leaf-blades straight, conduplicate (commonly) or flat, 6–14 cm long, 1.8–2 mm wide. Leaf-blade surface scabrous, rough on both sides, glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle capitate, 2.5–4 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.2 mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower longer than upper sometimes subequal). Lower glume lanceolate, 7.5–9.2 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous (densely), rough generally. Lower glume apex acute (shortly awned), muticous or mucronate. Upper glume lanceolate, 7–9 mm long, 1 -veined. Upper glume surface asperulous. Upper glume apex entire, acute (shortly awned).

Florets. Fertile lemma subterete, 4–5.5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined (densely). Lemma surface scabrous, rough above, without grooves. Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 7–14 mm long limb, without a column. Lateral lemma awns present, ascending, 5.5–12 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Bahia, Maranhao, Piaui. Bahia, Ceará, Maranhão, Pernambuco, Paraíba, Piaui, Rio Grande do Norte (RN). Pará.

Aristida eludens K.W. Allred & J. Valdes-Reyna. *Novon* 5(3): 212 (1995).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Coahuila: San Lorenzo Canyon, ca. 8 km S of Saltillo, mountain scrub grassland vegetation with Berberis, Bouteloua, Hilaria, Saylirion, very rocky sandy loam, flat bajada on N-facing side of canyon, 6000 ft (1830 m), 3 Sep 1991, *J. Valdis-Reyna* 2254 (HT: ANSM; IT: NMSU).

Illustrations (Journals): *Novon* (5:213, Fig.3 (1995)).

Derivation (Clifford & Bostock 2007): *L. eludo*, avoid. Not to be confused with a series of closely related species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 35–80 cm long. Culm-internodes terete, distally glabrous. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths longer than adjacent culm internode, without keel, smooth or scaberulous, glabrous on surface. Ligule a fringe of hairs, 0.2–0.3 mm long. Leaf-blades flat or conduplicate, 15–35 cm long, 1–1.5 mm wide. Leaf-blade surface smooth or scaberulous, rough abaxially, glabrous or puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle, comprising 16–20 fertile spikelets. Panicle contracted, linear, 10–23 cm long, 1–2 cm wide. Primary panicle branches appressed, 5–9 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3–1 mm long, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13 mm long, 1 length of upper glume, membranous, light brown, 1 -veined. Lower glume lateral veins absent. Lower glume surface glabrous. Lower glume apex acute. Upper glume lanceolate, 8–13 mm long, 1–1.3 length of adjacent fertile lemma, membranous, light brown, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned or 3 -awned. Principal lemma awn geniculate or 3-branched, with 5–10 mm long limb, with twisted column. Column of lemma awn (3–)4–5 mm long. Lateral lemma awns absent or present, 0.1–3 mm long, shorter than principal. Palea 1 mm long, hyaline, 2-keeled.

Flower and Fruit. Lodicules 2, 1–1.5 mm long. Anthers 3, 2–2.5 mm long. Caryopsis with adherent pericarp, fusiform, 6 mm long, dark brown.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico, Southwest Mexico.

Coahuila, Chihuahua, Durango, Guanajuato, Neuvo Leon, Queretaro, San Luis Potosi. Oaxaca.

Aristida engleri Mez. Fedde, *Repert.* 17:147 (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.G.A. Engler 6717*, 4 May 1913, Namibia: Namabezirk, Kuibis-Steinsteppe, 1300 m (B; IT: US-81051 (fragm. ex B)).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984) (as var. *engleri* & var. *ramosissima*).

Derivation (Clifford & Bostock 2007): in honor of Heinrich Gustav Adolph Engler (1844–1930) German botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending or decumbent, 35–50 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades flat or involute, 7–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, 10–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–6 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex obtuse. Upper glume lanceolate, 9–10 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, subterete, 5–8 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 20 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 4.5 mm long. Lateral lemma awns present, 15 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Namibia, North-West, Northern Cape.

Aristida erecta Hitchcock. *Contrib. U. S. Nat. Herb.* 12: 236 (1909).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: C. Wright 3432 [2432], 1865, Cuba (US-41161; IT: GOET, NY-71008). Orig. publ. cites "...2432, which is an error for 3432."

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. held upright. Spikelets or inflorescence branches held erect.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–150 cm long. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat, 50–100 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 25–50 cm long. Primary panicle branches appressed, 5–10 cm long, bearing spikelets almost to the base. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 12–15 mm long, 1.2 length of upper glume, membranous, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate or setaceously acuminate. Upper glume linear, 10–12 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 12–13 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 20–30 mm long limb. Lateral lemma awns present, spreading less than principal, 15–25 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida exserta S. T. Blake. *Proc. Roy. Soc. Queensl.* 51: 172 (1940).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Blake 6130, 11 Jun 1934, Australia: Queensland: North Kennedy Dist.: Mt. Remarkable, near Pentland (BRI: IT: BRI, K, MEL).

Illustrations (Books): J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(26)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 182, Fig.8 (1992)).

Derivation (Clifford & Bostock 2007): L. exserted. Peduncle longer than in related species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 45–75 cm long. Culm-internodes smooth, distally glabrous. Lateral branches fastigiate. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.3 mm long. Leaf-blades filiform, involute, 4–8 cm long, 0.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, 10–15 cm long, 1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.5–10 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface smooth to scabrous. Lower glume apex emarginate or acute, awned, 1 -awned, awn 0.5–1.3 mm long. Upper glume lanceolate, 6.7–10 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 0.5–1.3 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, with 9.5–11 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 8.5–10.5 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 5–6 mm long. Hilum linear, 0.2–0.3 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia.

Kimberley, Ereman. Darwin & Gulf, Victoria R & Barkly Tableland. North, Central, Inland.

Aristida ferrilateris S.M. Phillips. *Kew Bulletin* 41(4): 1029. 1986.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Yemen. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Wood 1142*, North Yemen: Jibla (K).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (79, Fig. 33).

Derivation (Clifford & Bostock 2007): *L. ferreus*, iron; laterus, side. In honor of John Richard Ironside Wood (1944-) English plant collector and botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40–70 cm long. Ligule a fringe of hairs. Leaf-blades flat or convolute, 4–20 cm long, 1–3 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong, 3–20 cm long. Primary panicle branches appressed or spreading, simple, bearing spikelets almost to the base. Panicle branches glabrous in axils or bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 7.5–12 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface glabrous or pubescent. Lower glume apex obtuse or acute, mucronate. Upper glume subulate or lanceolate, 8–13 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse or acute, mucronate.

Florets. Fertile lemma lanceolate, subterete, 7–9.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of

palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn triquetrous below, with 13–20 mm long limb, without a column, persistent. Lateral lemma awns present, ascending, 8–15 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea). Arabian Peninsula. Saudi Arabia, Yemen.

Aristida filifolia (Arech.) Herter. *Rev. Sudamer. Bot.* 9: 99 (1953).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. **Basionym or Replaced Name:** *Aristida pallens* f. *filifolia* Arech., *An. Mus. Nac. Montevideo* 4:75 (1902). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *Arechavaleta s.n.*, Nov 1886, Uruguay: colinas pedregosas de Minas (W-16092).

Illustrations (Books): B.Rosengurt, *Gramineas Uruguayas I* (1970) (210, Fig. 86).

Derivation (Clifford & Bostock 2007): *L. filum*, thread; folium, leaf. Leaf-blades very narrow.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 40–80 cm long. Lateral branches lacking. Leaf-sheaths striately veined, smooth. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades convolute, 25–30 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle, comprising 7–12 fertile spikelets. Panicle open, dense, 20–40 cm long, bearing few spikelets. Primary panicle branches appressed or ascending, 1–2 -nate, bearing 1–2 fertile spikelets on each lower branch.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, 30–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated.

Glumes. Glumes persistent. Lower glume lanceolate, 18–20 mm long, 0.4–0.6 length of upper glume, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 30–50 mm long, 1 -veined. Upper glume apex acuminate.

Florets. Fertile lemma subterete, 16–20 mm long, without keel, 3 -veined, 0–3 -veined. Lemma surface asperulous, rough above. Lemma margins convolute. Lemma apex with outer margin prolonged as a hyaline appendage, with this appendage 0.2–0.5 mm long, awned, 3 -awned. Principal lemma awn straight, with 100–150 mm long limb. Lateral lemma awns present, ascending, 100–150 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast. Uruguay. Catarina, Rio Grande do Sul.

Aristida flabellata Caro. *Kurtziana* 1: 148 (1961).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Csrdo: Sierra de Pocho falda O. cerca de los tuneles subiendo desde la llanura oeste, ruta 20, 5 Mar 1959, A.T. Hunziker, A. Cocucci & J.A. Caro 14174 (HT: CORD)

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. flabella*, fan; -ata, possessing. Culms fan-shaped at the base.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Basal innovations intravaginal, flabellate. Culms erect, 40–50 cm long, 1–2 -noded. Culm-internodes terete, distally glabrous. Culm-nodes glabrous. Lateral branches sparse, arising from lower culm. Leaf-sheaths longer than adjacent culm

internode, striately veined, smooth or scaberulous. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Collar glabrous. Leaf-blades conduplicate or convolute, 3.5–15 cm long, 1.5–2 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, continuous or interrupted, 17–20 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.75 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.75 length of upper glume, membranous, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume apex mucronate. Upper glume lanceolate, 5–9 mm long, 1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 5.5–8.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 8–15 mm long limb. Lateral lemma awns present, 6–13 mm long, subequal to principal or shorter than principal. Palea 1 mm long, 0.1–0.2 length of lemma, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2. Anthers 3. Caryopsis with adherent pericarp, 7–7.5 mm long, light brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast.

San Luis. Cordoba.

Aristida flaccida Trin.& Rupr. *Mem. Acad. Petersb. Ser. 6, 7: 117.* (1842).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Langsdorff s.n.*, Jan, Brazil: in montibus Carassae prope Capanima (LE-TRIN-1302.01). IT: *L. Riedel s.n.*, Jan 1876-Feb 1876, Brazil: in montibus Carassae prope Capanima (US-81045 (fragm. e xLE)).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (507, Fig. 108).

Derivation (Clifford & Bostock 2007): L. unable to support its own weight. Inflorescence branches long and thin and so droop.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 26–45 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades straight, convolute, 8–32 cm long, 1.2–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open (pauciflore), 16–20 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.7 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 11–12 mm long, 3(–5) -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex acute, mucous. Upper glume lanceolate, 13–16(–20) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute.

Florets. Fertile lemma subterete, 19–25 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 19–25 mm long limb, without a column. Lateral lemma awns present, ascending, (4–)7–8(–9) mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast, Brazil North, Brazil South.

Minas Gerais, Rio de Janeiro, Espírito Santo, Sao Paulo Parana, Catarina, Rio Grande do Sul. Rondonia. Minas Gerais, Rio de Janeiro, Sao Paulo. Paraná, Rio Grande do Sul, Santa Catarina.

Aristida floridana (Chapm.) Vasey. *Gram. U. St.* 21. (1885).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Streptachne floridana* Chapm., *Fl. S. U. St.* 554 (1860). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *J.L. Blodgett s.n.*, 18??, USA: Florida: Key West (L (fragm. ex US), NY-273725, US-77250).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (322).

Derivation (Clifford & Bostock 2007): *L.-ana*, indicating location. From Florida State, USA.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms erect, 60 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface or pilose. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, dense, 20–30 cm long. Primary panicle branches ascending, 2–4 cm long, bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches capillary. Spikelets solitary. Fertile spikelets sessile and pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume linear, 6–7 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 6–7 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn curved, ascending, 20 mm long overall, with 20 mm long limb. Lateral lemma awns absent.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA, Mexico. Florida. Southeast Mexico. Campeche, Quintana Roo, Yucatan.

Aristida forsteri B.K. Simon. *Austrobaileya* 4(2): 147 (1994).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Queensland: Darling Downs District: head of Pariagara Creek, Wondul Range, 28.11S, 151.02E, 12 Apr 1992, *P.I.Foster & P. Machim PIF9793* (HT: BRI; IT: CANB, K, MEL).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (88, Fig. 15), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Paul Irwin Forster (1961-) Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–50 cm long, 1–1.5 mm diam., 2–3 -noded. Culm-internodes scaberulous, distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Leaf-sheaths mostly shorter than adjacent culm internode, striately veined, scaberulous, glabrous on surface. Ligule a fringe of hairs, 0.6 mm long. Collar glabrous. Leaf-blades involute, 7–14 cm long, 1 mm wide. Leaf-blade surface scaberulous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–13 cm long, 1 cm wide. Primary panicle branches appressed, 1–2 cm long. Panicle branches scaberulous, with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4 mm long, pubescent, obtuse. Floret callus hairs 0.7 mm long.

Glumes. Glumes lower deciduous, upper persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–4.5 mm long, 1.1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 3.2–4.2 mm long, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma linear, subterete, 2.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 8 mm long limb. Lateral lemma awns present, 6 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, ellipsoid, sulcate on hilar side, 2 mm long. Embryo 0.33 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland. South East.

Aristida fragilis Hitchcock & Ekman. *N. Am. Fl.* 17 :393 (1935).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman 16784*, 18 Jun 1923, Cuba: Pinar del Rmo: San Juan and Martmnez, in pinales ad La Tea, white sands (US-1024372; IT: LE, US-1538518, US-1024373).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. weak. Inflorescences readily disarticulating.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long, wiry. Lateral branches lacking. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 1–10 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long. Primary panicle branches appressed, 1–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, pungent.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 4 mm long, 0.6 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous, rough above. Lower glume apex acute. Upper glume linear, 7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 10 mm long limb. Lateral lemma awns present, ascending, 10 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida fredscholzii H. Scholz & Kurschner. *Willdenowia* 30(2): 273–274, f. 1a. (2000).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 17 cm long. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty. Ligule a fringe of hairs. Leaf-blades convolute, 2–6 cm long, 0.5–1 mm wide. Leaf-blade surface smooth, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 5–8 cm long, bearing few spikelets. Primary panicle branches distant. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.5 mm long, pilose, obtuse. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4–6 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Upper glume lanceolate, 4–6 mm long, 0.66–0.8 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent.

Florets. Fertile lemma elliptic, laterally compressed, 5–9 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, muticous or awned, 1 -awned. Principal lemma awn straight, 0.5–1.5 mm long overall.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Arabian Peninsula. Oman.

Aristida friesii Hackel ex Henrard. *Meded. Herb. Leid.* No. 54, 186 (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.E. Froes 1301a*, 28 Feb 1902, Bolivia: Junaca prope Tarija, loco graminoso in regione subalpina (W-22175 (photo, herb. Sulekic)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (32).

Illustrations (Journals): *Darwiniana* (41: 170, fig.6 (2003)).

Derivation (Clifford & Bostock 2007): in honor of Robert Elias Fries (1876–1966) Swedish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long. Culm-internodes antrorsely scabrous. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, antrorsely scabrous. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades 20–30 cm long, 3 mm wide. Leaf-blade surface scabrous, rough on both sides, glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle. Peduncle antrorsely scabrous above. Panicle open, elliptic, 15 cm long, contracted about primary branches. Primary panicle branches appressed or ascending, 1–3 -nate. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.25 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, 0.85 length of upper glume, membranous, 3 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough on veins. Lower glume apex acuminate, mucronate. Upper glume lanceolate, 8 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, acuminate, mucronate.

Florets. Fertile lemma linear, subterete, 7–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface granulate. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, awned, 3 -awned. Principal lemma awn 3-branched, with 9–10 mm long limb. Lateral lemma awns present, 8 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Western South America, Southern South America.** Bolivia. Argentina Northeast.
Salta.

Aristida funiculata Trin. & Rupr. *Mem. Acad. Petersb. Ser. 6, 7:* 159. (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (& as *A. royleana*).

Illustrations (Books): L.Boulos, *Flora of Egypt* 4 (2005) (239, Pl. 70), K.M.Matthew, *Further Illustrations on the Flora of Tamilnadu Carnatic* (1988) (Pl.713), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 198).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 11).

Derivation (Clifford & Bostock 2007): *L. funis*, rope; *-ula*, diminutive; *-ata*, possessing. The twisted column of the awn resembles a rope.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 15–30 cm long, wiry. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades flat or conduplicate, 4–10 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 20–30 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume linear, 17–25 mm long, 4–6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex attenuate.

Florets. Fertile lemma elliptic, subterete, 4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–45 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn (2–)3–4.5 mm long. Lateral lemma awns present, 35–45 mm long, subequal to principal. Palea 0.25 length of lemma, without keels.

Flower and Fruit. Anthers 3.

n = 11 (1 ref TROPICOS).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Liebmann 646*, Jan, Mexico: Veracruz: Mirador (C).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. gemini*, twins; *flos*, flower. Spikelets in pairs on a common peduncle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms erect, 50–60 cm long. Leaf-sheaths scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs. Leaf-blades involute, 5–10 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, loose, 10–15 cm long. Primary panicle branches ascending, 1-nate, 3 cm long, bearing 4–6 fertile spikelets on each lower branch. Spikelets solitary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12 mm long, 1.1 length of upper glume, membranous, 1-veined. Lower glume lateral veins absent. Upper glume lanceolate, 11 mm long, 1.4 length of adjacent fertile lemma, membranous, 1-veined. Upper glume lateral veins absent.

Florets. Fertile lemma linear, subterete, 8 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3-awned. Principal lemma awn 3-branched, recurved at base of limb, with 8 mm long limb, with twisted column. Column of lemma awn 6 mm long. Lateral lemma awns present, 1 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Gulf (Mexico). Veracruz.

Aristida gentilis Henrard. *Meded. Herb. Leid.* No. 54, 196 (1926).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. *Hitchcock 7448*, 2 Oct 1910, Mexico: Aguascalientes: Aguascalientes, , 6300 ft, weed, edge of field (L-922.342–255; IT: US-991622).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* of the same clan. Belonging in the same Section of the genus.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 50–100 cm long, 1–2-noded. Culm-internodes smooth or scaberulous. Leaf-sheaths keeled. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades convolute, 10–20 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex filiform.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 25–35 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading, branching divaricately, 10–15 cm long. Panicle branches flexuous, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 14 mm long, 1.05–1.1 length of upper glume, membranous, 1-veined. Lower glume primary vein scabrous.

Lower glume lateral veins absent. Lower glume surface glabrous to pubescent. Lower glume apex setaceously acuminate. Upper glume linear, 13 mm long, 1.2 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 11 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 15 mm long limb. Lateral lemma awns present, 12 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico, Northwest Mexico, Southwest Mexico. Aguascalientes, Durango, Guanajuato, San Luis Potosi, Zacatecas. Sonora. Jalisco, Oaxaca.

Aristida gibbosa (Nees) Kunth. *Enum. Pl.* 1: 189. (1830).

Recent Synonyms: *Aristida sorzogonensis* J. Presl, *Reliq. Haenk.* 1(4–5): 224 (1830).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. gibba*, swelling; *-osa*, indicating abundance. Spikelets swollen asymmetrically.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms (32–)45–90 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded (deciduous hairs). Ligule a ciliolate membrane, 0.2–0.4 mm long. Collar glabrous. Leaf-blades straight, conduplicate, 10.5–42 cm long, 1.8–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, hairless except near base, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, (8–)12–24 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.2–0.3 mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower in general slightly longer than upper, sometimes subequal or lower slightly shorter than upper). Lower glume lanceolate, 5.2–11.8 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume apex acute (shortly awned). Upper glume lanceolate, 5–9.8 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute (shortly awned).

Florets. Fertile lemma subterete, (4.5–)5–11.5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth, with a median groove (ventral,longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (8–)8.8–19.5 mm long limb, with twisted column. Column of lemma awn (1–)1.5–4 mm long. Lateral lemma awns present, ascending, (6–)7–14 mm long, shorter than principal.

Distribution (TDWG). Continent. North America, South America (and Central America).

Country /Province /State. Mexico (as *A. orizabensis*). Central Mexico, Northeast Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico, Southeast Mexico. **Mesoamerica, Caribbean, Northern South America, Western South America, Brazil.** Costa Rica, Honduras, Panama. Guyana, Venezuela. Bolivia, Colombia. Brazil Southeast.

Distrito Federal, Mato Grosso, Goiás. Bahia, Maranhão, Piauí, Rio Grande do Norte (RN). Amapá, Pará, Roraima. Minas Gerais, Rio de Janeiro, São Paulo. Distrito Federal, Mexico State, Morelos, Puebla, Tlaxcala. Chihuahua, Durango, Guanajuato. Veracruz. Sinaloa, Sonora. Guerrero, Jalisco, Michoacán, Nayarit, Oaxaca. Campeche, Chiapas.

Aristida glauca (Nees) Walp. *Ann. Bot.* 1:925 (1849).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Mexico. **Basionym or Replaced Name:** *Chaetaria glauca* Nees, *Linnaea*, 19: 688 (1847). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *A. Aschenborn 251*, Mexico (B; IT: US-865703 (fragm. ex B & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. glauca*, bluish-green. Whole plant or any of its parts glaucous.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 15–30 cm long. Culm-internodes distally glabrous or pubescent. Leaf-sheaths smooth or scaberulous, glabrous on surface or puberulous. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.2–0.5 mm long. Leaf-blades curved, involute, 5–10 cm long, 0.7–1.5 mm wide, stiff, glaucous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–18 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pubescent, pungent.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 0.5–0.66 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 7–12 mm long, 0.9 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 8–15 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 15–20 mm long limb, with twisted column. Column of lemma awn 1–4 mm long. Lateral lemma awns present, spreading as much as principal, 15–20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

$n = 22$ (1 ref TROPICOS). $2n = 44$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. **Southwestern USA, South-central USA, Mexico.** Central Mexico, Northeast Mexico, Northwest Mexico, Southeast Mexico.

Puebla, Aguascalientes, Coahuila, Neuvo Leon, San Luis Potosi, Tamaulipas, Zacatecas. Baja California, Sonora, Chiapas.

Aristida glaziovii Hackel ex Henrard. *Meded. Herb. Leid.* No. 54, 204 (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *A.F.M. Glaziou 20107*, 1892, Brazil: Minas Gerais (W-15602; IT: US-1341398, US-1126809 (fragm. ex W & photo)).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (53, Fig. 18 as *A. glaziouii*).

Derivation (Clifford & Bostock 2007): in honor of Auguste Francois Marie Glaziou (fl. 1833–1906) French-born artist and Brazilian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 100–130 cm long. Lateral branches sparse or lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.3–0.5 mm long. Collar glabrous or pubescent. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 18–39 cm long, 1.5–4.5 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), 20–37 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.8–1 mm long, pilose, acute.

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 7.5–12 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume apex acute. Upper glume lanceolate, 5.5–8 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute.

Florets. Fertile lemma subterete, 7–9.8 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough generally, without grooves. Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 17–30 mm long limb, without a column. Lateral lemma awns present, ascending, 14–28 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. gracilis*, slender; *pes*, foot. Pedicels slender.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms geniculately ascending, 60–115 cm long. Culm-internodes smooth or scaberulous, distally glabrous. Lateral branches fastigiate. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs, 0.5 mm long. Collar glabrous. Leaf-blades involute, 4–8 cm long, 0.5 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 12–21 cm long, 1–3 cm wide. Primary panicle branches 4–6 cm long. Panicle branches with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4–10 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acuminate. Upper glume lanceolate, 4–10 mm long, 0.5–0.9 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate.

Florets. Fertile lemma lanceolate, subterete, 8–11 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, with 10–20 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 10–16 mm long, subequal to principal or shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 6–8 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland.
North, Central, South East, Inland. Coast.

Aristida granitica B.K. Simon. *Austrobaileya* 2(1): 91 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Queensland: North Kennedy District: Mt. Pring, 10 km W of Bowen, 18 Apr 1978, *Simon 3423* (HT: BRI-257519).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (96, Fig. 17), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 157, Fig.3 (1992)).

Derivation (Clifford & Bostock 2007): Eng. granite; L. *-ica*, belonging to. Growing on granitic soils.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 35 cm long. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths smooth, glabrous on surface. Leaf-sheath oral hairs ciliate, 2–4.5 mm long. Ligule a fringe of hairs, 0.3 mm long. Leaf-blades involute, 10–21 cm long, 1.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 7–19 cm long, 8 cm wide. Primary panicle branches 3-nate, 1–2.4 cm long. Panicle branches glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, compressed slightly, 12–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.6 mm long, pubescent, acute. Floret callus hairs 1–1.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–8 mm long, 0.6 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume primary vein scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 12–13 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute or acuminate, muticous.

Florets. Fertile lemma lanceolate, laterally compressed, 8–9 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, spreading, with 22 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 12–14 mm long. Lateral lemma awns present, spreading less than principal, 11 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear, 0.6 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.
Central.

Aristida guayllabambensis Laegaard. *Flora of Ecuador* 57: 49, f. 9A-C. 1997.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Laegaard 51740*, 8 Mar 1984, Ecuador: Pichincha: near Guayllabamba, N of Quito, 00:03'S, 78:21'W, dry slopes and roadsides with some grazing, alt. 2000 m (AAU!; IT: MO-5198263, QCA, US-3351511).

Illustrations (Books): G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 50, Fig. 9 (1997)).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, 40–60 cm long, 0.5 mm diam. Culm-internodes striate, scaberulous, distally glabrous. Leaf-sheaths subequal to internodes, striately veined, glabrous on surface. Leaf-sheath oral hairs lacking or ciliate, 1–2 mm long. Ligule a fringe of hairs, 0.2–0.4 mm long. Leaf-blades erect, convolute, 10–20 cm long, 2–2.5 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bracteate at branch bases. Panicle open, linear, 10–30 cm long, 1–2 cm wide, contracted about primary branches. Primary panicle branches appressed, 1-nate, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.7 mm long, pubescent, acute. Floret callus hairs 0.3–0.7 mm long.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 1 length of upper glume, membranous, purple, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute to attenuate. Upper glume lanceolate, 7–9 mm long, 1.4–1.8 length of adjacent fertile lemma, membranous, purple, 1-keeled, 1-veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute to attenuate.

Florets. Fertile lemma linear, subterete, 5 mm long, 0.3–0.7 mm wide, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface asperulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3-awned. Principal lemma awn with 10 mm long limb. Lateral lemma awns present, 6–10 mm long, subequal to principal or shorter than principal. Palea oblanceolate, 0.5 mm long, 2-veined.

Flower and Fruit. Lodicules 2, 0.6 mm long. Anthers 3, 2–2.5 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador.

Aristida gypsophila Beetle. *Phytologia* 49(1): 36–37. 1981.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Coahuila: western Coahuila, north facing mountainside, gypsum banks, western base of Picacho del Fuste, northeasternly from Tanque Vaionetta, ca. lat. 27:34'N, 23–25 Aug 1941, *I. M. Johnston* 8399 (HT: US)

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (327).

Derivation (Clifford & Bostock 2007): Gk. *gypsos*, gypsum; *phileo*, love. Growing on gypsum soils.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–80 cm long. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades curled, filiform, 1 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear. Primary panicle branches appressed. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5.5–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–6 mm long, 0.9 length of upper glume, membranous. Lower glume apex acuminate. Upper glume lanceolate, 5.5–7.5 mm long, membranous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 1-awned or 3-awned. Principal

lemma awn straight or geniculate, with 10 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 2 mm long. Lateral lemma awns absent or present, 0–1 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. South-central USA, Mexico. Texas. Northeast Mexico. Southern South America. Uruguay.

Coahuila, Chihuahua, San Luis Potosi.

Aristida gyrans Chapm. *Coult. Bot. Gaz.* iii. 18. (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.W. Chapman s.n., no date, USA: Florida: Roberts Key (NY; IT: US-966071, W).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (341).

Derivation (Clifford & Bostock 2007): *L. gyro*, turn round in a circle. Awns forming loose spirals on drying.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 40–70 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades involute, 10–15 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 15–30 cm long. Primary panicle branches appressed, bearing 1–3(–6) fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 7–8 mm long, 0.7–0.8 length of upper glume, membranous, 2 -veined. Lower glume primary vein smooth. Lower glume apex setaceously acuminate. Upper glume linear, 10–11 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex scabrous, with a short cylindrical neck, with this appendage 0.5 mm long, awned, 3 -awned. Principal lemma awn spreading, with 10–15 mm long limb. Lateral lemma awns present, gyrate, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida, South Carolina.

Aristida hackelii Arech. *Anal. Mus. Montevid.* 4, 1: 79. (1902).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. Arechavaleta s.n.*, Oct–Nov, Uruguay: campos de Independencia (MVFA; IT: US-2434280).

Illustrations (Books): B.Rosengurt, *Gramineas Uruguayas I* (1970) (212, Fig. 87).

Derivation (Clifford & Bostock 2007): in honor of Eduard Hackel (1850–1926) Bohemian-born Austrian botanist with special interest in the grasses.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 20–30 cm long. Ligule a fringe of hairs. Leaf-blades involute, 4–7 cm long, 1 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong, 6–10 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 0.5 length of fertile spikelet, scabrous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 13–14 mm long, 1.1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous, rough above. Lower glume apex acuminate. Upper glume linear, 12 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 8–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 35–40 mm long limb, with twisted column. Column of lemma awn 4 mm long. Lateral lemma awns present, 35–40 mm long, subequal to principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Uruguay.

Aristida hamulosa Henrard. *Meded. Herb. Leid.* No. 54, 219 (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *J.W. Toumey s.n.*, 30 Sep 1892, USA: Arizona: Tucson (L-923.156–861; IT: US-664054, US-664054 (fragm. ex L)).

Illustrations (Books): F.W.Gould, *The Grasses of Texas* (1975) (397, Fig. 211).

Derivation (Clifford & Bostock 2007): *L. hamus*, hook; *-ula*, diminutive; *-osa*, abundance. Lemma base and awn with reflexed barbs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–75 cm long. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 10–30 cm long, 1–3 mm wide. Leaf-blade surface scabrous, glabrous, hairless throughout or except near base.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 10–40 cm long, with spikelets clustered towards branch tips. Primary panicle branches spreading or reflexed, 8–15 cm long. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–15 mm long, 1–1.1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 9–15 mm long, 1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 10–15 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, ascending, with 8–25 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–3 mm long. Lateral lemma awns present, spreading less than principal, 8–25 mm long, subequal to principal or shorter than principal.

Flower and Fruit. Anthers 3.

$2n = 44$.

Distribution (TDWG). Continent. North America, South America.
Country /Province /State. Southwestern USA, South-central USA, Mexico. Arizona, California, New Mexico, Texas. **Mesoamerica.** Belize, Guatemala, Honduras.

Aristida hassleri Hack. *Bull. Herb. Boiss. Ser. 2*, 4: 277. (1904).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Paraguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *E. Hassler 8346*, 1901-Jan 1902, Paraguay: Amambay, in regione cursus superiores fluminis Apa (W-15599; ILT: G, K, MO, US-81038 (fragm. ex W-15599 & photo), W-15597). LT designated by Henrard, *Meded. Rijks-Herb.* 54(A): 222 (1927).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Emil Hassler (1861–1939) Swiss-born Paraguayan botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 60–90 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 12–20 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 15–25 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.5–0.6 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 8.5–10(–12) mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume apex acute, mucicous or mucronate. Upper glume lanceolate, 6.5–7(–8) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 5–6(–8) mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous (densely), rough above, with a median groove (ventral,longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight or flexuous (slightly), ascending or spreading, simple at base, with (16–)18–20(–25) mm long limb, with a straight or slightly twisted column. Column of lemma awn 3–3.8(–4) mm long. Lateral lemma awns present, ascending, 13–16(–23) mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Western South America, Southern South America. Bolivia. Brazil South. Paraguay.

Catarina, Rio Grande do Sul.

Aristida havardii Vasey. *Bull. Torrey Bot. Club.* 13: 27. (1886).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *V. Havard 28*, Oct 1883, USA: Texas: Western Texas, Ft. Davis, Marfa etc., prairie (US-81037; IT: W-15595).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (325).

Derivation (Clifford & Bostock 2007): in honor of Valery Havard (1846–1927) United States physician and amateur botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 15–40 cm long. Culm-internodes distally glabrous. Leaf-sheaths without keel, outer margin hairy. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 5–15 cm long, 0.5–1.5 mm wide.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, oblong, effuse, 6–18 cm long, 0.5 of culm length. Primary panicle branches spreading or reflexed, 3–6 cm long. Panicle branches with prominent pulvini. Spikelets spreading, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 8–13 mm long, 1.6–1.8 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 8–22 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–5 mm long. Lateral lemma awns present, 8–22 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. **Southwestern USA, South-central USA, Mexico** (as *A. barbata*). Arizona, Nevada, New Mexico, Texas. Central Mexico, Northeast Mexico, Northwest Mexico, Southwest Mexico. **Mesoamerica.** Guatemala.

Aristida helicophylla S. T. Blake. *Proc. Roy. Soc. Queensl.* 51: 171 (1940).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Queensland: Warrego District: between Charleville & Westgate, 20 Apr 1934, on red sand associated with *Eucalyptus melanophloia* & *Triodia*, S. T. Blake 5411 (HT: BRI; IT: BRI, CANB, K, MEL).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (128), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(16)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 179, Fig.7 (1992)), *Proc.Roy.Soc.Qld.* (51:176,Pl.4 (1940)).

Derivation (Clifford & Bostock 2007): Gk. *helix*, twisted; *phyllon*, leaf. Old leaf-blades curled in the manner of a watch-spring.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms 70–150 cm long. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous or pubescent. Leaf-blades 10–21 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 12–32 cm long, 1.5–4 cm wide. Primary panicle branches 4–8 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, acute. Floret callus hairs 0.5–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute to setaceously acuminate. Upper glume lanceolate, 6–8 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex emarginate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–5.5 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, pseudo-articulate at base, with 17–40 mm long limb, without a column, persistent. Lateral lemma awns present, 15–38 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 3 mm long. Hilum linear, 0.2 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.

North, Central, South East.

Aristida hintonii Hitchcock. *N. Am. Fl.* 17: 382 (1935).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.B. Hinton 1729*, 15 Sep 1932, Mexico: Mixico: Temascaltepec Dist.: Rincsn del Carmen (US-1610353; IT: MO-1104439).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of George Bode Hinton (1882–1943) United States botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–130 cm long. Leaf-sheaths glabrous on surface or pilose. Ligule a fringe of hairs. Leaf-blades flat or involute, 25–50 cm long, 3–4 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 20–40 cm long, with spikelets clustered towards branch tips. Primary panicle branches 10–15 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–6.5 mm long, 0.5–0.75 length of upper glume, membranous, purple, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume lanceolate, 7–8.5 mm long, 1–1.4 length of adjacent fertile lemma, membranous, purple, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex attenuate.

Florets. Fertile lemma linear, subterete, 5–9 mm long, coriaceous, purple, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 7–10 mm long limb, with twisted column. Column of lemma awn 5–6 mm long. Lateral lemma awns present, 1–2 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distrito Federal, Mexico State. Tamaulipas. Guerrero, Jalisco, Michoacan, Nayarit, Oaxaca.

Aristida hispida Henrard. *Meded. Herb. Leid.* No. 58 A. 195 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zimbabwe. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *J.M. Rattray 16* (L holo, K, SRGH) , 14 Feb 1930, Zimbabwe: District Matopos: black land paddocks, alt. 4500 ft [1371 m] (L-931.267–26). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 721 (1933).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. hispidus*, bristly; *-ula*, diminutive. With minutely hispid glumes.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–70 cm long, 2–3 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades conduplicate or convolute, 4–8 cm long, 0.5–1 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 10–15 cm long, with spikelets clustered towards branch tips. Primary panicle branches appressed or spreading, distant, 1–2 -nate, 1–6 cm long. Panicle branches glandular (in axils), pubescent, pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 9–10 mm long, 1.2–1.5 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scaberulous. Lower glume surface puberulous. Lower glume apex acuminate, mucronate. Upper glume linear, 6–8.5 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous, rough above. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 5–5.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above or in lines. Lemma margins involute, covering most of palea. Lemma apex acuminate, awned, 3 -awned. Principal lemma awn 3-branched, with 8–11 mm long limb, persistent. Lateral lemma awns present, 7–10 mm long, subequal to principal or shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Zimbabwe.

Aristida hitchcockiana Henrard. *Meded. Herb. Leid.* No. 54 A. 233 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Oaxaca: Las Sedas, anno 1894, *L. Smith 918* (HT: US-991670).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Albert Spear Hitchcock (1865–1935), United States agrostologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 70 cm long. Culm-internodes terete, striate, scaberulous, distally glabrous or pubescent. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, striately veined. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades flat or convolute, 15–25 cm long, 1–3 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 25 cm long, 1 cm wide, bearing few spikelets. Primary panicle branches appressed, 1 -nate, 5–6 cm long, bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11 mm long, 1.1 length of upper glume, membranous, light brown or purple, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute. Upper glume lanceolate, 10 mm long, 1.4 length of adjacent fertile

lemma, membranous, light brown or purple, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex erose, truncate, mucronate.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, ascending, with 16–18 mm long limb, with twisted column. Column of lemma awn 3 mm long. Lateral lemma awns present, spreading less than principal, 9–10 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Southwest Mexico. Puebla. Guanajuato, Queretaro, Zacatecas. Jalisco, Nayarit, Oaxaca.

Aristida holathera Domin. *Biblioth. Bot.* 1, 5: 340 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Domin s.n.*, Dec 1910, Australia: Queensland: Cook Dist.: Hugel und Savannenwalder, bei Chillagoe (L-926.361–524 (photo, BRI, K); IT: BRI).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): Gk. *holos*, wholly; ather, spike or ear of wheat. Awn not disarticulating from base of lemma at maturity.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual or perennial, caespitose, clumped loosely or moderately. Culms 28–128 cm long, 2–5 -noded. Culm-internodes mid-green or glaucous, smooth or scaberulous, distally glabrous. Lateral branches lacking or sparse or ample. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 0.5–3 mm long. Ligule a fringe of hairs, 0.3–0.5 mm long. Collar glabrous or pubescent. Leaf-blades straight or flexuous, filiform or linear, flat or conduplicate or involute, 10–25 cm long, 2–4 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–41 cm long, 1–10 cm wide. Primary panicle branches 2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.8–3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–16 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex emarginate. Upper glume lanceolate, 12–25 mm long, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acute or acuminate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 8–13.5 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous or papillose, rough above. Lemma margins convolute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 34–78 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 18–57 mm long. Lateral lemma awns present, 27–66 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 4.8–7.9 mm long. Hilum linear, 0.3–0.4 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. **Malesia.** Philippines. **Australia.** New South Wales, Northern Territory, Queensland, South Australia, Victoria, Western Australia.

Kimberley, Ereman. Darwin & Gulf, Victoria R & Barkly Tableland, Central Australia. NW & Lake Eyre, Southern. North, Central, South East, Inland. Western Slopes, Western Plains.

Aristida hordeacea Kunth. *Rev. Gram.* 2, 1: 173. (1831).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Senegal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Leprieur* 2, Senegal (B; IT: P).

Illustrations (Books): R.M.Phill, F.T.E.A., *Gramineae* (1(1970):151, Fig. 48), G.V.Pope et al., *Flora Zambesiaca* 10, M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Derivation (Clifford & Bostock 2007): L. *-acea*, resembling. Inflorescence as with *Hordeum*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, 10–90 cm long. Culm-internodes distally pubescent. Culm-nodes pubescent. Leaf-sheaths keeled. Ligule a fringe of hairs. Leaf-blades flat or conduplicate, 5–20 cm long, 2–5 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, continuous or interrupted, 5–15 cm long. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–0.8 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 0.8 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface glabrous or hispidulous. Lower glume apex dentate, acute, awned, 1 -awned, awn 2.5–5 mm long. Upper glume lanceolate, 6–9 mm long, 1.2–1.3 length of adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface glabrous or hispidulous. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–4 mm long.

Florets. Fertile lemma elliptic, subterete, 5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous (hooked prickles), rough in lines. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 25–35 mm long limb, deciduous, abscissing from top of lemma. Lateral lemma awns present, 25–35 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. **West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa.** Burkina, Ghana, Mali, Nigeria, Senegal, Niger. Burundi, DRC. Eritrea, Ethiopia (inc. Eritrea), Sudan. Kenya, Tanzania, Uganda. Angola, Malawi, Mozambique, Zambia, Zimbabwe. Namibia, Botswana.

Aristida hubbardiana Schweickerdt. *Notizbl. Bot. Gart. Berlin*, 14: 196 (1938).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Dinter* 7600, Apr 1934, Namibia: Tsumeb (B). .

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (311, Fig. 276).

Derivation (Clifford & Bostock 2007): In honor of Charles Edward Hubbard (1900–1980) English agrostologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, slender, 25–50 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat or convolute, 5–10 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear or lanceolate, 3–6 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels absent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–7 mm long, 0.66–1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex awned, 1 -awned. Upper glume lanceolate, 7 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume awned, 1 -awned.

Florets. Fertile lemma elliptic, subterete, 6–7 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex rostrate, awned, 3 -awned. Principal lemma awn with 20–30 mm long limb, persistent. Lateral lemma awns present, 20–30 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, lanceolate, sulcate on hilar side.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Namibia, Botswana.

Aristida humbertii Bourreil. *Adansonia*, n.s. 9: 421 (1969).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms erect, 150–180 cm long. Ligule a fringe of hairs.

Inflorescence. Inflorescence a panicle. Panicle open. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–6.75 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–6.8 mm long, 0.75 length of upper glume, scariosus, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 6–6.75 mm long, 1.1 length of adjacent fertile lemma, scariosus, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma elliptic, subterete, 5.75–6 mm long, coriaceous, without keel. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, 1–1.5 mm long overall.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa. Angola.

Aristida humidicola S.M. Phillips. *Kew Bull.*, 55(1): 203 (2000).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Tanzania: Mpanda Distr.: 56 km on Uvinza-Mpanda road, 5°9'S, 30°2'E, 1600 m, 21 May 1007, *Bidgood, Sitoni, Vollesen & Whitehouse 4406* (HT: K; IT: NHT).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. humidus*, moist; *cola*, dweller. Growing on the margins of lakes.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, culms solitary. Culms slender, 11–18 cm long. Leaves mostly basal. Leaf-sheaths loose, striately veined. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades conduplicate, 2–3.5 cm long, 1 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–12 cm long. Primary panicle branches appressed. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8.6–9.7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, winged, with this appendage 1.5 mm long, pubescent, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 8.6–9.7 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear or oblong, 7.5–7.8 mm long, 2–2.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex attenuate, mucronate.

Florets. Fertile lemma linear, subterete, 3 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth, villous, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 18–22 mm long limb, with twisted column, persistent. Column of lemma awn 13–14 mm long. Lateral lemma awns present, 16–18 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa. Kenya.

Aristida hygrometrica R. Br. *Prod.* 174. (1810).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *R. Brown* 6196, 14 Feb 1803, Australia: Northern Territory: Darwin & Gulf Region, Arnhem North Bay (Melville Bay) (BM; ILT: BRI (fragm., photo ex BM), E, K). LT designated by Henrard, *Meded. Rijks Herb.* 54(A): 248 (1927).

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (167, Pl. 49), J.R.Wheeler et al, *Flora of the Kimberley Region* (1992) (1125, Fig. 324), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(6)), D.Sharp & B.K.Simon, *AusGrass*. Derivation (Clifford & Bostock 2007): Gk. *hygros*, water; *metron*, measure; *-ike*, belonging to. Aquatic or swamp species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect or geniculately ascending, 29–84 cm long. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate, 1–2 mm long. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades curled or flexuous, filiform, involute, 11–27 cm long, 0.8–1.2 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 14.4–35 cm long, 7–15 cm wide. Primary panicle branches 2-nate, 2–3.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 25–43 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 4–6 mm long, pubescent, pungent. Floret callus hairs 0.4–1.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 13.5–23 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex emarginate or obtuse. Upper glume lanceolate, 25–42.6 mm long, 2.5–3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate, mucronate or awned, 1 -awned, awn 0.5–3.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–16 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, flat below, with 85–150 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 53–85 mm long. Lateral lemma awns present, 81–140 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 2 mm long. Caryopsis with adherent pericarp, 6.6–8.5 mm long. Hilum linear, 0.33 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia.

Kimberley, Eremean. Darwin & Gulf, Victoria R & Barkly Tableland, Central Australia. North, Central, Inland.

Aristida hystricula Edgew. *Journ. Linn. Soc.* 6: 208. (1862).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Stocks 187 (partim.)*, India: Sindh and Multan (CAL?).

Illustrations (Books): T.A.Cope, *Flora of Pakistan* 143: *Poaceae* (1982).

Derivation (Clifford & Bostock 2007): L. *-ula*, diminutive. Resembling Hystrix in the form of the inflorescence.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect, 5–15 cm long. Ligule a fringe of hairs. Leaf-blades curved, involute, 2–4 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 2–4 cm long, bearing few spikelets. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9.5–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.6 mm long, pilose, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–5.5 mm long, 0.5 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 0.5–1 mm long. Upper glume lanceolate, 9.5–11 mm long, 3–4 length of adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–1.5 mm long.

Florets. Fertile lemma elliptic, subterete, 2.5–3.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface hispid. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 60 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 20 mm long. Lateral lemma awns present, 40 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Pakistan.

Aristida hystrix Nees. *Linnaea* 7: 287 (1832).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Aristida rigida* Roth, non Cav.(1799), *Nov. Pl. Sp.* 42 (1821). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Kvning s.n.*, India: habitat in Malabar (LINN; IT: M, S).

Recent Synonyms: *Aristida rigida* Roth, non Cav.(1799), *Nov. Pl. Sp.* 42 (1821).

Illustrations (Books): K.M.Matthew, *Illustrations on the Flora of Tamilnadu Carnatic* (1982) (Pl. 806 & 807), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 437).

Derivation (Clifford & Bostock 2007): resembling *Hystrix*. Usually a reference to the inflorescence resembling that of *Hystrix*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 60–130 cm long. Culm-nodes glabrous. Leaf-sheaths 3.5–9 cm long. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades convolute, 10–40 cm long, 2–3 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–20 cm long, 10–20 cm wide. Panicle branches capillary, bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 4–7 mm long, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.5–3 mm long, bearded, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–9 mm long, 0.66 length of upper glume, scarious, yellow, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex awned, 1 -awned, awn 2.5–3 mm long. Upper glume lanceolate, 13–14 mm long, 1.5 length of adjacent fertile lemma, scarious, yellow, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume awned, 1 -awned, awn 1.5–2 mm long.

Florets. Fertile lemma elliptic, subterete, 9–10 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 50–60 mm long limb, persistent. Lateral lemma awns present, 50–60 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China, Malesia. India. Myanmar. Philippines. Kerala. Madhya Pradesh, Tamilnadu.

Aristida inaequiglumis Domin. *Biblioth. Bot.* 1, 5: 347 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *K. Domin s.n.*, Mar 1910, Australia: Queensland: North Kennedy Dist.: Savannewldlder bei Pentland (PR; IT: BR, L (photo, BRI)).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 168, Fig.5 (1992)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);, K.O.Mallett (ed.). *Flora of Australia*, Vol 44 A (2002) & Vol 44B (2004). *Poaceae*;

Derivation (Clifford & Bostock 2007): *L. inaequalis*, unequal; *gluma*, husk. Glumes differing in length and/or shape.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms 32–155 cm long, 1-noded. Culm-internodes glaucous, smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode, smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs pubescent, 0.3–1.1 mm long. Ligule a fringe of hairs, 1 mm long. Collar glabrous. Leaf-blades curled, 15–30 cm long, 2.3–4.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, equilateral or nodding, 13–40 cm long, 1.5–4 cm wide. Primary panicle branches appressed, 4-nate, 4–8 cm long, bearing spikelets almost to the base. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–18.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.9–1.5 mm long, pubescent, acute.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–18.5 mm long, 1.4 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex emarginate, mucronate. Upper glume lanceolate, 6.4–13 mm long, 1.4–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume apex emarginate, mucronate, 1-awned.

Florets. Fertile lemma lanceolate, subterete, 3.7–9 mm long, coriaceous, pallid or light brown, without keel, 3-veined, 0–3-veined. Lemma surface smooth or scaberulous, rough above. Lemma margins involute, covering most of palea, without distinctive roughness or tuberculate (along groove). Lemma apex acute, awned, 3-awned. Principal lemma awn pseudo-articulate at base, with 14–46 mm long limb, without a column, persistent. Lateral lemma awns present, 11–40 mm long, subequal to principal or shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 3.1–7 mm long. Hilum linear, 0.4–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, South Australia, Western Australia.

Kimberley, Ereman. Darwin & Gulf, Victoria R & Barkly Tableland, Central Australia. NW & Lake Eyre. North, Central, Inland.

Illustrations (Journals): *Austr. Syst. Bot.* (5: 179, Fig.7 (1992)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): L. disagreeable. The sharp callus enables the spikelets to catch on to clothing.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms 41–155 cm long. Culm-internodes smooth, distally glabrous. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate, 4 mm long. Ligule a fringe of hairs, 0.5–1 mm long. Collar pubescent. Leaf-blades curled, 10–23 cm long, 3–4 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 11–42 cm long, 1.5–4 cm wide. Primary panicle branches bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–14 mm long, 1–1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute to setaceously acuminate. Upper glume lanceolate, 6–12 mm long, 1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex emarginate or acute or acuminate, mucous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–8 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface papillose. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn pseudo-articulate at base, triquetrous below, with 10–30 mm long limb, without a column, persistent. Lateral lemma awns present, 8–28 mm long, subequal to principal or shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia. Kimberley, Darwin & Gulf, Victoria R & Barkly Tableland. North, Central, Inland.

Aristida inversa Hackel apud R. E. Fries. *Arkiv Bot. Stockh.* 8: No. 8, 37 (1909).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.E. Fries 1589*, 17 Apr 1902, Bolivia: Gran Chaco, Fortin Crevaux ad Rmo Pilcomayo, in campo siccis apricis (W-15583; IT: US-1162487, US-72632 (fragm. ex W)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. inverto*, turn upside down. Contrary to expectation, the lower glume is larger than the upper glume.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms erect or geniculately ascending, 70–110 cm long. Culm-nodes swollen. Lateral branches lacking or sparse, arising from lower culm. Leaf-sheaths tight, mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Collar glabrous. Leaf-blades conduplicate, 15–30 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins cartilaginous, scaberulous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong, 20–30 cm long, 1 cm wide, contracted about primary branches. Primary panicle branches appressed, 2 -nate, 4–8 cm long. Panicle axis smooth. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 12 mm long, 3–4 length of upper glume, membranous, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned. Upper glume lanceolate, 3–4 mm long, 0.5 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex obtuse or acute.

Florets. Fertile lemma linear, subterete, 7–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 30 mm long limb. Lateral lemma awns present, 30 mm long, subequal to principal. Palea oblong, 1.5–2 mm long, 0.2–0.25 length of lemma, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 1.75 mm long. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia. Argentina Northeast.

Buenos Aires.

Aristida jacobiana B.K. Simon & I.D. Cowie. *Telopea* 13: 150 (2010).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Northern Territory: Nitmiluk National Park, 20 km N of Edith Falls: C.R. *Michell* 3717; holo: DNA; iso: BRI, CANB, NSW.

Illustrations (Journals): *Telopea* (13: 151, Fig 1 (2011)).

Derivation (Clifford & Bostock 2007): named for Surrey Jacobs (1946–2009), Senior Principal Research Scientist at the National Herbarium of New South Wales (NSW).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 20–60 cm long, 4–6-noded. Culm-internodes smooth, distally glabrous. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths longer than adjacent culm internode, smooth, glabrous on surface. Leaf-sheath oral hairs ciliate, 1–2 mm long. Ligule a fringe of hairs, 0.2 mm long. Collar pilose. Leaf-blades filiform or linear, flat or conduplicate or involute or convolute, 5–12 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough abaxially, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, continuous or interrupted, 5–20 cm long, 0.5–2 cm wide. Primary panicle branches appressed, 2-nate, 1–2.5 cm long. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–1 mm long, pubescent, acute. Floret callus hairs 0.1–0.3 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–6.5 mm long, 0.5–0.6 length of upper glume, membranous, 1-veined. Lower glume lateral veins absent. Lower glume apex acute or acuminate, mucronate, awn 1–2 mm long. Upper glume lanceolate, 6–11 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, mucronate, awn 0.5–1.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 5.5–9 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 9–18 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 1.5–2 mm long. Lateral lemma awns present, spreading as much as principal, 9–185 mm long, subequal to principal.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland. Darwin & Gulf. North.

Aristida jaliscana R. Guzman M. & Jaramillo. *Phytologia* 51(7): 470 (1982).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Jalisco: Mun. de Chimaltitan: cerca del arroyo de Los Sabinos y cerro El Muerto, entre San Juan de Potreros y Atolinga, en bosque de pino y encino 26 Sep 1981, J. J. *Muñoz* & F. J. *Avila M. s.n.* (HT: IBUG).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-anum*, indicating location. From Jalisco, Mexico.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–100 cm long. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades involute, 14–30 cm long, 3 mm wide. Leaf-blade surface pilose, sparsely hairy, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 20–30 cm long, 1 cm wide. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets linear, subterete, 11–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident.

Glumes. Glumes shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 9–11 mm long, 1 length of upper glume, membranous, 1-keeled. Lower glume primary vein scaberulous. Lower glume surface pilose. Lower glume apex dentate, 2 -fid, awned, 1 -awned. Upper glume lanceolate, 9–11 mm long, 0.75 length of adjacent fertile lemma, membranous. Upper glume primary vein scaberulous. Upper glume surface pilose. Upper glume apex dentate, 2 -fid, awned, 1 -awned.

Florets. Fertile lemma linear, subterete, 11–14 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 9–15 mm long limb, with twisted column. Column of lemma awn 2.5–5 mm long. Lateral lemma awns present, spreading as much as principal, shorter than principal.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico, Southwest Mexico. Guanajuato. Jalisco.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 176, Fig.6 (1992)).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Jericho, Queensland, Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 30–60 cm long. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous or pubescent. Leaf-blades flexuous, involute, 16–18 cm long, 2 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 4–15 cm long, 1–2 cm wide. Primary panicle branches 1–3.5 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–9 mm long, 1 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume surface smooth to scabrous. Lower glume apex acute or

acuminate, mucicous or mucronate. Upper glume lanceolate, 5–9 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume lateral veins absent or distinct. Upper glume surface smooth to scabrous. Upper glume apex emarginate or obtuse, mucicous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–7 mm long, coriaceous, pallid or light brown or purple, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness or scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 12–24 mm long limb, without a column, persistent. Lateral lemma awns present, 10–21 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 3.5–4.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. **Australia.** New South Wales, Northern Territory, Queensland, South Australia.

Aristida jorullensis Kunth. *Rev. Gram.* 1: 62. (1829).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bonpland s.n.*, Sep, Mexico: Playas de Jorullo (P; IT: US-77249 (fragm. & photo)).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (54, Fig. 13).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From the "Players der Jorulla", Mexico.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose, clumped densely. Culms 10–60 cm long, 1–8 -noded. Culm-internodes solid, distally glabrous. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs, 0.1–0.2 mm long. Leaf-blades conduplicate or involute, 4–20 cm long, 1–1.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle 7–15 cm long. Panicle open, elliptic, 6–20 cm long. Primary panicle branches 1 -nate, 1–4 cm long, bearing spikelets almost to the base. Panicle axis pilose. Panicle branches pilose. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute. Floret callus hairs 1 mm long.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume linear, 4.5–9 mm long, 0.9–1.1 length of upper glume, membranous, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume linear, 5–8.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1–3 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent or distinct. Upper glume apex acute.

Florets. Fertile lemma linear, laterally compressed, 4–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above or in lines. Lemma margins convolute, covering most of palea. Lemma apex attenuate, awned, 1 -awned. Principal lemma awn flexuous, 10–16 mm long overall, with 10–16 mm long limb, without a column. Lateral lemma awns absent. Palea 1–1.5 mm long.

Flower and Fruit. Anthers 3, 1.1–1.7 mm long.

$2n = 22$ (2 refs TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. **Mexico.** Gulf (Mexico), Northwest Mexico, Southwest Mexico, Southeast Mexico. **Mesoamerica, Northern South America, Western South America.** Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panama. Venezuela. Colombia.

Aristida jubata (Arech.) Herter. *Rev. Sudamer. Bot.* 9: 98 (1953).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. **Basionym or Replaced Name:** *Aristida pallens* f. *jubata* Arech., *An. Mus. Nac. Montevideo* 4:74 (1902). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Arechavaleta s.n.*, Uruguay: campo de Tacuarembos, en terrenos arenosos (MVM; IT: W-15517).

Illustrations (Books): A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (213, Fig. 77), B.Rosengurt, *Gramineas Uruguayas I* (1970).

Derivation (Clifford & Bostock 2007): *L. jubum*, mane; -ata, possessing. The inflorescence or awn resembles a fox tail.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 40–80 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades straight, convolute, 25–30 cm long, 0.5–1 mm wide. Leaf-blade surface scabrous, rough on both sides, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open (patent), 20–40 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, pilose, acute.

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 20–35 mm long, 3 -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex acuminate. Upper glume lanceolate, 35–50 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acuminate, awned.

Florets. Fertile lemma subterete, (11–)14–16 mm long, without keel, rounded except near apex, 3 -veined, 0–3 -veined. Lemma surface scabrous or smooth (less frequent), rough above, without grooves. Lemma margins convolute. Lemma apex with outer margin prolonged as a hyaline appendage, with this appendage 1–1.5 mm long, awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (125–)150–230 mm long limb, without a column. Lateral lemma awns present, ascending, (125–)150–230 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil West Central, Brazil Southeast, Brazil South. Argentina Northeast, Paraguay, Uruguay.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. forma*, appearance. Resembling *Juncus* mostly in habit.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Roots simple (spongy). Rhizomes absent or short. Culms 20–60 cm long. Culm-internodes elliptical in section (below nodes), distally glabrous. Leaf-sheath oral hairs lacking or bearded. Ligule a fringe of hairs. Leaf-blades straight or curled, involute, 10–30 cm long, 1–1.5 mm wide. Leaf-blade surface glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, interrupted, dense, 5–20 cm long, contracted about primary branches. Panicle branches glabrous in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3–0.5 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.6–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, mucronate or awned, 1 -awned, awn 0–2 mm long. Upper glume lanceolate, 6–9 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate or mucronate or awned, 1 -awned, awn 0–2 mm long.

Florets. Fertile lemma elliptic, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 8–23 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 1–3(–6) mm long. Lateral lemma awns present, 7–17 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Keller 163, 1891, Somalia: Ogaden (Z; US-81220 (fragm. ex W), W-15572).

Illustrations (Books): R.M.Phillip, F.T.E.A., *Gramineae* (1(1970):154, Fig. 49), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (83, Fig. 34), T.A.Cope, in M.Thulin, *Poaceae* (Gramineae). *Flora of Somalia* (1995) (164, Fig. 81).

Derivation (Clifford & Bostock 2007): in honor of A. Keller (1873–1945) Swiss botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–30 cm long, wiry. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 4–20 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, oblong, 3–4 cm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–1 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex lobed, 2 -fid, mucronate. Upper glume lanceolate, 9–12 mm long, 3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex lobed, 2 -fid, awned, 1 -awned, awn 3–4 mm long.

Florets. Fertile lemma elliptic, subterete, 3–3.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 30–60 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 7–20 mm long. Lateral lemma awns present, 15–30 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea), Somalia. Kenya.

Aristida kenyensis Henrard. *Meded. Herb. Leid.* No. 54 C. Suppl., 722. (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Kenya. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 24829, 14 Sep 1929, Kenya: Nairobi to Kisumu, grass plots Scott Laboratory (L-932.28–88; IT: US-1446300).

Illustrations (Books): R.M.Phillips, F.T.E.A., *Gramineae* (1(1970):149, Fig. 47), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Kenya.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 15–90 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades flat or conduplicate, 5–15 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–20 cm long, with spikelets clustered towards branch tips. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 5–8 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Fertile lemma elliptic, laterally compressed, 5–9 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 6–15 mm long limb, persistent. Lateral lemma awns present, 6–15 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Eritrea, Ethiopia (inc. Eritrea). Kenya, Tanzania, Uganda.

Aristida kerstingii Pilger. *Engl. Jahrb.* 4: 127. (1904).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Togo. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: Kersting 541, Sep 1902, Westafrika: Togo: Sokodo-Basari, bei Koukomba in einzeln Bueschen (B (destroyed)). LT designated (as type) by Henrard, *Meded. Rijks-Herb.* 54(A): 277 (1927). ST: *Flegel s.n.*, Benue.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Otto Kersting (-) German botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 30–90 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, involute, 10–20 cm long, 1–1.5 mm wide, stiff. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 10–20 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, with longer hairs above, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 15–20 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acuminate, awned, 1 -awned, awn 12–15 mm long. Upper glume linear, 20–30 mm long, 5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 45–110 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 30–70 mm long. Lateral lemma awns present, 25–95 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

$n = 22$ (1 ref TROPICOS). $2n = 22$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa. Burkina, Ghana, Guinea, Ivory Coast, Nigeria, Senegal, Togo. Cameroon.

Aristida kimberleyensis B.K. Simon. *Austrobaileya* 2(1): 91 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Western Australia: Cardner District: Carson Escarpment, 29 km ENE of Doongan, 23 March 1978, *M. Lazarides* 8660 (HT: CANB-283118; IT: BRI).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 204, Fig.12 (1992)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From the Kimberley Region of north-western Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms rambling, 50–100 cm long, 6 -noded. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Ligule a fringe of hairs, 0.3 mm long. Leaf-blades 10–20 cm long, 2 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20–40 cm long, 1–2 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–15 mm long, 1.1–1.2 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 10–14 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 9–14 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 20–25 mm long limb, without a column, persistent. Lateral lemma awns present, 18–23 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia.

Kimberley.

Aristida kunthiana Trin. & Rupr. *Mem. Acad. Petersb. Ser. 6, 5*:151 (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Senegal. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: prope Richard-Tol., *Lelivre s.n.* (HT: B (herb. Kunth)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Karl Sigismund Kunth (1788–1850), German botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Butt sheaths glabrous. Culms 30–45 cm long. Culm-internodes distally glabrous. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades flat or convolute, 5–20 cm long, 2–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–15 cm long. Primary panicle branches simple, 3–10 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pilose, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, acuminate, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 5–8 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent.

Florets. Fertile lemma elliptic, subterete, 5–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough in lines. Lemma margins involute, covering most of palea. Lemma apex acuminate, awned, 3 -awned. Principal lemma awn 3-branched, with 15–25 mm long limb, without a column, deciduous, abscissing from top of lemma. Lateral lemma awns present, 10–20 mm long, subequal to principal or shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa. Mali, Senegal.

Aristida laevigata Hitchcock & Ekman. *N. Am. Fl.* 17: 390 (1935).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman 15170*, 21 Sep 1922, Cuba: Prov. Oriente: Sierra de Nipe, pinelands at the headwaters of the Rmo Piloto, alt. 750 m (US-125006; IT: LE, NY-70999).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. smooth and polished. Plant generally glabrous.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–100 cm long. Culm-internodes distally glabrous. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades curved or flexuous, involute, 10–20 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 20–30 cm long, contracted about primary branches. Primary panicle branches ascending, 1 -nate, 7–15 cm long. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets linear, subterete, 12–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes dissimilar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume linear, 12 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous, rough above. Lower glume apex acuminate. Upper glume linear, 12 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous, rough above. Upper glume apex dentate, 2 -fid, acute, mucronate.

Florets. Fertile lemma linear, subterete, 12–14 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading or reflexed, with 12–20 mm long limb. Lateral lemma awns present, spreading less than principal, 2–5 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida laevis (Nees) Kunth. *Enum. Pl.* 1: 192 (1830).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Chaetaria laevis* Nees, *Agrost. Bras.* 2: 384 (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Sello s.n.*, s.d., Brazil: South Brazil (B; IT: K, LE-TRIN-1300.01 (Hb. Chamisso no d.1638), LE-TRIN-1300.02 (ex hb. de Schlechtendal 1827), LE-TRIN-1300.03, US-865704 (fragm. ex LE & photo), W).

Recent Synonyms: *Aristida altissima* Arech., *Anal. Mus. Montevid.* 4. 50: 80 (1902).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (507 & 533, Fig. 108 & 115), B.Rosengurt, *Gramineas Uruguayas I* (1970), K.Domin, *Bibliotheca Botanica* 85 (1915) (33).

Derivation (Clifford & Bostock 2007): *L. laevis*, smooth. Lacking hairs or roughness, usually of leaf-blades or lemmas.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 40–130 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or scanty (deciduous). Ligule a ciliolate membrane, 0.2 mm long. Collar pubescent (continuous). Leaf-blades straight, flat or conduplicate (less frequent), (8–)15–60 cm long, 1.7–3.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (linear), 10–30 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.7–1 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, (8–)10–15 mm long, 1 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, (10–)15–20 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate, awned.

Florets. Fertile lemma subterete, 10–14 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (23–)25–40(–46) mm long limb, without a column. Lateral lemma awns present, ascending, (23–)25–40(–46) mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Aristida lanigera H.M. Longhi-Wagner. *Kew Bull.* 49(4): 819 (1994).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Goias: between Mineiros and Jatai, 28 Apr 1990, *Filgueiras 2323* (HT: ICN; IT: IBGE, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. lana*, wool; gero, bear. Glumes invested with long hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 85–95 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking. Ligule a ciliolate membrane, 0.3–0.5 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 40–60 cm long, 2.8–5 mm wide. Leaf-blade surface woolly, hairless throughout, densely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), 15–29 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.5 mm long, pilose, obtuse (subobtuse).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, (3.5–)5–5.5 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume apex acute, mucous. Upper glume lanceolate, 6–6.8 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma subterete, 8–8.5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 11–18 mm long limb, without a column. Lateral lemma awns present, ascending, 9–16 mm long, slightly shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central. Goiás.

Aristida lanosa Muhl. *Cat. Pl.* :14 (1813).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Carolina (CHARL).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (339).

Derivation (Clifford & Bostock 2007): *L. lana*, wool; -osa, abundance. Leaf-sheath woolly.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Butt sheaths woolly. Culms 70–150 cm long. Lateral branches lacking. Leaf-sheaths without keel, woolly. Ligule a fringe of hairs, 0.2–0.5 mm long. Leaf-blades filiform, flat or involute, 20–50 cm long, 1–3 mm wide. Leaf-blade surface scabrous, glabrous or hispid, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–40 cm long, 2–8 cm wide. Primary panicle branches appressed or ascending, 6–15 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets linear, subterete, 12–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–14 mm long, 1.2–1.5 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth or scabrous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 10 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth or scabrous. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 8–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading or reflexed, with 15–25 mm long limb, without a column. Lateral lemma awns present, spreading less than principal, 10–15 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, South-central USA, Southeastern USA. Oklahoma. Texas. Alabama, Arkansas, Georgia, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. latus*, broad; *folium*, leaf. Leaf-blades broad or relatively broad with respect to related species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms 20–131 cm long, 2 -noded. Culm-internodes smooth, distally glabrous. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths scaberulous, glabrous on surface. Leaf-sheath oral hairs lacking or bearded, 0–6 mm long. Ligule a fringe of hairs, 0.5–1 mm long. Leaf-blades curled, 35–70 cm long, 2–4.5 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 8–69 cm long, 3–3.5 cm wide. Primary panicle branches 5–10 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–13 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate, muticous or awned, 1 -awned, awn 0.4 mm long. Upper glume lanceolate, 8–17 mm long, 1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral

veins absent. Upper glume surface asperulous or scabrous. Upper glume apex acute or acuminate, muticous or awned, 1 -awned, awn 0–4 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–11 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 17–50 mm long limb, with a straight or slightly twisted column or with twisted column, persistent. Column of lemma awn 1–9 mm long. Lateral lemma awns present, 15–45 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 5–7.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland, South Australia, Western Australia.

Kimberley, Ereman. Darwin & Gulf, Victoria R & Barkly Tableland, Central Australia. NW & Lake Eyre, Southern. North, Central, South East, Inland. Western Plains.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): in honor of Peter Kenneth Latz (1941-) Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 45–90 cm long. Culm-internodes scaberulous, distally glabrous. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, scaberulous. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades filiform, involute, 10–20 cm long, 1 mm wide, stiff.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–37 cm long, 1 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4 mm long, pubescent, acute. Floret callus hairs 1.2 mm long.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–9 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 7–10 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 7–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 6–15 mm long limb, without a column, persistent. Lateral lemma awns present, 6–15 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory.
Central Australia.

Illustrations (Journals): *Darwiniana* (41: 173, fig.7 (2003) as var. *longiramea*).

Derivation (Clifford & Bostock 2007): L. loose. Inflorescence much branched either as a single panicle or from branching of the culms.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with curly dead sheaths. Culms 50–100 cm long, 1–1.5 mm diam. Culm-internodes solid, distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths keeled, glabrous on surface. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades involute, 15–30 cm long, 1–2.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially, glabrous, hairless except near base.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 25–45 cm long. Primary panicle branches ascending, 1-nate, 4–8 cm long. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute. Floret callus hairs 1–1.5 mm long.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 9.5–11.5 mm long, 0.9 length of upper glume, membranous. Lower glume surface scabrous. Lower glume apex acute. Upper glume linear, 10–12 mm long, 1 length of adjacent fertile lemma, membranous. Upper glume surface smooth. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 10–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 24–30 mm long limb, with a straight or slightly twisted column. Column of lemma awn 5–9 mm long. Lateral lemma awns present, shorter than principal.

Flower and Fruit. Anthers 3, 1.6 mm long.

$2n = 44$ (1 ref TROPICOS).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 182, Fig.8 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Mike Lazarides (1928-) Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 40–140 cm long, 3–5-noded. Culm-internodes glaucous, smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate, 0.5 mm long. Ligule a fringe of hairs, 0.3 mm long. Collar glabrous or pubescent. Leaf-blades curled, involute, 10–20 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–45 cm long, 5–20 cm wide. Primary panicle branches 4–8 cm long. Panicle branches scaberulous or scabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–19 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.6 mm long, pilose, acute. Floret callus hairs 2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–19 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 8–19 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 4–5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn curved, flat below, with 13–37 mm long limb, without a column, persistent. Lateral lemma awns present, 10–31 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 5–8.5 mm long. Hilum linear, 0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia. Kimberley, Ereman. Darwin & Gulf. North, Central, South East, Inland.

Derivation (Clifford & Bostock 2007): Gk. *leptos*, slender; *oura*, tail. Awns filiform.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 25–55 cm long. Ligule a fringe of hairs. Leaf-blades involute, 6–20 cm long, 1 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 7–14 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.5–3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 20 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex attenuate, awned, 1 -awned, awn 10 mm long. Upper glume linear, 20 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume apex attenuate, awned, 1 -awned, awn 10 mm long.

Florets. Fertile lemma lanceolate, subterete, 10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 60–65 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 30 mm long. Lateral lemma awns present, 60–65 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Aristida leucophaea Henrard. *Meded. Herb. Leid.* No. 54 A. 298 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Zimbabwe. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Salisbury, 1440 m.s.m., Maio 1920, *F. Eyles* 2238 (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *leukos*, white; *phaeos*, grey. Panicles pale-colored.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–90 cm long. Culm-internodes distally woolly. Leaf-sheaths glabrous on surface or pilose. Ligule a fringe of hairs. Leaf-blades curled, 10–20 cm long, 1.5–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, interrupted, 5–15 cm long, contracted about primary branches. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3 mm long, bearded, truncate.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–8 mm long, 0.9–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute, mucicous or mucronate or awned, 1 -awned, awn 0–1.1 mm long. Upper glume lanceolate, 5–8 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucicous or mucronate.

Florets. Fertile lemma elliptic, subterete, 5–6.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 8–17 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn (0.5–)1.5–2.5(–5.5) mm long. Lateral lemma awns present, 7–13 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa. Tanzania. Angola, Mozambique, Zambia, Zimbabwe.

Aristida liebmannii Fourn. *Mex. Gram.* :78 (1886).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Liebmann 662*, Apr 1842, Mexico: Veracruz: Mirador (C; IT: MO, US-207485, US-991666 (fragm. ex LE), US-1389797).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Frederik Michael Leibmann (1813–56), Danish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long. Leaves mostly basal, distichous. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat, 1–2 mm wide. Leaf-blade surface puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 6–15 cm long. Primary panicle branches ascending, bearing spikelets almost to the base. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 8–9 mm long, 1.1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 8–9 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 8–9 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 20 mm long limb. Lateral lemma awns present, spreading as much as principal, 20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Gulf (Mexico), Southwest Mexico, Southeast Mexico. Mesoamerica. Guatemala, Honduras.

Veracruz. Oaxaca. Chiapas.

Aristida lignosa B.K. Simon. *Austrobaileya* 2(1): 92 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 204, Fig.12 (1992)).

Derivation (Clifford & Bostock 2007): *L. lignum*; wood; *-osa*, abundance. Culms woody.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 100–200 cm long, 3–4 -noded. Culm-internodes smooth, distally glabrous. Lateral branches ample. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades 15–30 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear or lanceolate, 7–30 cm long, 0.5–5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, acute. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–8 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 7–10 mm long, 0.9–1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous or scabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–11 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough generally. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 14–23 mm long limb, without a column, persistent. Lateral lemma awns present, 11–20 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland. North, Central, South East, Inland. Coast, Tablelands.

Aristida lisowskii T. Richel. *Bull. Soc. Roy. Bot. Belg.*, 117(2): 317 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from DRC. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Zaire, Lualaba: *Lisowski 98700* (POZG holo, BR).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honour of Stanislaw Lisowski (1924–2002) Polish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, 10–20 cm long, 1–2 -noded. Culm-internodes distally glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades convolute, 2–5 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10 cm long. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 30–50 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, bearded, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–12 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 8–12 mm long, 3–3.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 2.5–3.5 mm long, coriaceous, without keel. Lemma surface puberulous, hairy above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 18–25 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 17–22 mm long. Lateral lemma awns present, 18–25 mm long, subequal to principal.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa. DRC.

Aristida longespica Poir. *Encyc. Suppl.* 1: 452. (1810).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L.A.G. Bosc s.n.*, no date, USA: Carolina (P; IT: C, US-2947176 (fragm. ex P)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (331 as var. *longespica* & *geniculata*), F.W.Gould, *The Grasses of Texas* (1975) (393, Fig. 208 & 394, Fig. 209 as var. *longespica* & *geniculata*).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *spica*, thorn. With long spikelets or inflorescence branches.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Butt sheaths glabrous or pilose. Culms geniculately ascending, 20–60 cm long, wiry. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades filiform, flat or involute, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 10–35 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 3–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, 0.2 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3–9 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 3–9 mm long, 0.75–1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex entire or dentate, 3 -fid, acute or acuminate.

Florets. Fertile lemma linear, subterete, 4–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn reflexed, with 6–36 mm long limb, without a column. Lateral lemma awns present, spreading as much as principal, 2–25 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(25)), K.Domin, *Bibliotheca Botanica* 85 (1915) (Pl.15 as *A.adscensionis* var. *longicollis*).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 209, Fig.14 (1992)).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *collum*, neck. Column of awn long.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–80 cm long, 3 -noded. Culm-internodes glaucous, scaberulous, distally glabrous. Lateral branches ample. Leaf-sheaths striately veined, scaberulous, glabrous on surface. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs, 0.5–1 mm long. Collar pilose. Leaf-blades involute, 9–18 cm long, 2–3 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, elliptic, 9.5–20 cm long, 3–6 cm wide. Primary panicle branches 0.5–1.7 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.8 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–11 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acuminate to setaceous acuminate. Upper glume lanceolate, 7–13 mm long, 1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate to setaceous acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–9.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 15–25 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 1–5 mm long. Lateral lemma awns present, spreading as much as principal, 15–25 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 4–6.5 mm long. Hilum linear, 0.25 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland.
Central Australia. North, Central, Inland.

Aristida longiseta Steud. *Syn. Pl. Gram.* 420. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A. Fendler* 978, 1847, USA: New Mexico: probably Santa Fe Co.: Santa Fe (P; IT: F, MO, PH, US-81210). For locality information, see Allred, *Great Basin Naturalist* 50: 74 (1990).

Illustrations (Books): K.F.Best, et al, *Prairie Grasses* (1971) (63), F.W.Gould, *The Grasses of Texas* (1975) (404, Fig. 215), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:19(1980)).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *seta*, bristle. Glumes or lemmas long awned.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–35 cm long. Leaves mostly basal or basal and cauline. Leaf-sheaths without keel. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.5 mm long. Collar pubescent. Leaf-blades curved or flexuous, involute, 4–15 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, straight or flexuous, 4–15 cm long, bearing few spikelets. Primary panicle branches ascending or drooping, indistinct the panicle almost racemose or simple. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 16–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, pungent.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 0.5–0.66 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 16–25 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 13–15 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 40–100 mm long limb, without a column. Lateral lemma awns present, 40–100 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

$2n = 22$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America.

Country /Province /State. Northwest USA, North-central USA, Southwestern USA, South-central USA, Mexico. New Mexico.

Aristida longifolia Trin. *Mem. Acad. Petersb. Ser. 6*, 1: 84. (1831).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Riedel s.n.*, s.d., Brazil: Mato Grosso: in umbrosis siccis prope Cuiba (LE-TRIN-1305.06; IT: K, US-81213 (fragm. ex LE)).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *folium*, leaf. With long leaf-blades.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 70–130 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded (less frequent, deciduous). Ligule a ciliolate membrane, 0.2 mm long. Collar glabrous. Leaf-blades straight, flat, 35–75 cm long, 3–8 mm wide. Leaf-blade surface scabrous (densely), rough on both sides, glabrous, hairless throughout. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 30–60 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower shorter than upper, rarely subequal or upper slightly longer than lower). Lower glume lanceolate, 8.5–12(–14) mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acute, muticous. Upper glume lanceolate, 11–15 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute.

Florets. Fertile lemma subterete, 14.5–16(–18) mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface smooth, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with

20–33 mm long limb, without a column. Lateral lemma awns present, ascending, 20–33 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

TYPE from Paraguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *T. Rojas 9795*, Dec 1907, Paraguay: Sierra de Amabay: in campis siccis Punta Pora (W-15558; ILT: US-991924, US-81208 (fragm.), W-947). LT designated by Henrard, *Meded. Rijks-Herb.* 54(A): 321 (1927).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *makros*, large; *anthos*, flower. Spikelets large.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal or intravaginal. Culms erect, 40–80 cm long. Culm-internodes glaucous, smooth. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades flat or convolute, 10–70 cm long, 2–4 mm wide, stiff. Leaf-blade surface smooth or scaberulous, rough adaxially. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, dense, 30 cm long. Primary panicle branches 2-nate, 2 cm long. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 55 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3–4 mm long, pubescent, hairy on the margins, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 45 mm long, 0.8 length of upper glume, membranous, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume lanceolate, 55 mm long, membranous, 1-veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 10–11 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3-awned. Principal lemma awn with 120 mm long limb. Lateral lemma awns present, 110 mm long, subequal to principal. Palea 2.5 mm long.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia. Paraguay.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. E. Tennison Woods & M. Holtze 12*, 1886, Australia: Northern Territory: Darwin and Gulf Region (K; IT: BRI (fragm., photo ex K), MEL).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (91, Fig. 16), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 192, Fig.10 (1992)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): Gk. *makros*, large; *klados*, stem. Panicle branches long and slender.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–100 cm long, 5–9 -noded. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking or ciliate or bearded. Ligule a fringe of hairs, 0.3 mm long. Collar glabrous. Leaf-blades involute, 15–30 cm long, 1–2.3 mm wide. Leaf-blade surface glabrous or pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 17–24 cm long, 3–7 cm wide. Primary panicle branches 5–10 cm long. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–0.8 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–11 mm long, 0.66–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex emarginate, mucronate. Upper glume lanceolate, 6–15 mm long, 1.1–1.6 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 5.5–9.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–29 mm long limb, with a straight or slightly twisted column or with twisted column, persistent. Column of lemma awn 1–8 mm long. Lateral lemma awns present, 9–26 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 5–8 mm long. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. **Malesia, Papuaia.** New Guinea PNG, or West Papua (Irian Jaya). New Guinea. **Australia.** Northern Territory, Queensland.

Darwin & Gulf. North.

Aristida macrophylla Hackel. *Denkschr. Akad. Wien, Math.-Nat.* 79: 77 (1908).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M. Wacket s.n.*, 1902, Brazil: Sco Paulo: prope Pilar haud procul ab urbe Sco Paulo, 750–800 m (W-15557; IT: MO-4014762 (fragm. ex US), US-81206 (fragm. ex W & photo)).

Recent Synonyms: *Aristida kleinii* L.B. Smith, *Phytologia*. 22 (2): 88 (1971).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (476, Fig. 102 as *Aristida kleinii*).

Derivation (Clifford & Bostock 2007): Gk. *makros*, large; *phyllon*, leaf. Leaf-blades large.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 50–100 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded (deciduous). Ligule a fringe of hairs, 0.5–0.8 mm long. Collar glabrous. Leaf-blades flexuous (sometimes erect), flat (lower) or convolute (upper), 15–50(–55) cm long, 0.8 mm wide or 0.5–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially (densely), glabrous or pilose (sometimes), hairless except near base, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), (14–)18–23 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.5–0.7 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 10–14(–16) mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acuminate, mucous. Upper glume lanceolate, (6–)10–12 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute.

Florets. Fertile lemma subterete, 6–7(–10) mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough generally, with a median groove (ventral, longitudinal). Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight or flexuous, ascending or spreading, pseudo-articulate at base, with 16–20(–24) mm long limb, with twisted column. Column of lemma awn 5–7(–8) mm long. Lateral lemma awns present, ascending or spreading as much as principal, 14–18(–21) mm long, shorter than principal (slightly).

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Catarina, Rio Grande do Sul. Mato Grosso. Sao Paulo. Rio Grande do Sul, Santa Catarina. Misiones.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *G. Mandon* 1277, Mar-Apr 1861, Bolivia: La Paz; 2700 m (L-908.84–409, L-908.84–408, US-81204; IST: MO-2098286). ST: *Herzog* 1708, Mar 1911, Bolivia: auf Bergwiesen bei Samaipata, 1900 m (L).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Gilbert Mandon (1799–1866) French botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms erect, 45–60 cm long. Ligule a fringe of hairs. Collar glabrous or pubescent. Leaf-blades flat or involute, 25–45 cm long, 2–3 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 9–24 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9.5–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9.5–13 mm long, 1–1.05 length of upper glume, membranous. Lower glume apex acuminate. Upper glume lanceolate, 9.5–13 mm long, membranous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7–8.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 15–20 mm long limb, with twisted column, persistent. Column of lemma awn 3–5 mm long. Lateral lemma awns present, 15–20 mm long, subequal to principal.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Aristida marginalis Ekman. *Archiv Bot. Stockh.* 10 No. 17 23 (1911).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.O.A. Malme* 3143, 26 Apr 1903, Brazil: Mato Grosso: Cuiaba, in margine silvulae, loco sicco graminoso, arenoso-argilloso (S; IT: US-702283, US-81202 (fragm. ex S)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. margo*, border; *-alis*, pertaining to. The leaf-blades have conspicuously thickened marginal nerves.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–120 cm long. Lateral branches lacking or sparse. Leaf-sheaths smooth, glabrous on surface. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades 15–25 cm long, 2–3 mm wide, glaucous. Leaf-blade surface scabrous, rough adaxially, glabrous, hairless except near base. Leaf-blade margins cartilaginous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or oblong, 20 cm long, 3–6 cm wide, with spikelets clustered towards branch tips. Primary panicle branches appressed, 2–3-nate, 5–10 cm long. Panicle axis scabrous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–5.5 mm long, 1 length of upper glume, membranous, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, awned, 1-awned, awn 1.5–2.5 mm long. Upper glume lanceolate, 4.5–5.5 mm long, membranous, 1-veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, awned, 1-awned, awn 1 mm long.

Florets. Fertile lemma linear, subterete, 5 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1–2 mm long, awned, 3-awned. Principal lemma awn 3-branched, with 15 mm long limb. Lateral lemma awns present, 10 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Brazil West Central.

Mato Grosso. Mato Grosso.

Aristida megapotamica Spreng. *Syst. Cur. Post.* 31. (1827).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n.*, no date, Brazil: Rio Grande (B; IT: HAL, K, US-81198 (fragm. ex B & photo)). US-81199 (fragm. ex B), is *Stipa filifolia* Nees, but US-81198 (fragm. ex B) is an *Aristida*, this has led to the misapplication of the name *Aristida megapotamica* to *Stipa filifolia*.

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (275, Fig. 55), S.A.Renvoize, *The Grasses of Bahia*, 1984 (55, Fig. 19), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (507, Fig. 108), B.Rosengurt, *Gramineas Uruguayas I* (1970) (212, Fig. 87).

Illustrations (Journals): *Ruizia* (13:233, Fig 26e (1993)).

Derivation (Clifford & Bostock 2007): Gk. *mezas*, large; *potamos*, river; *-ike*, belonging to. Mostly from Rio Grande do Sal, now La Platte. Otherwise from the Amazon or Rio Grande, a district in southern Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms (37–)60–140 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded. Ligule a fringe of hairs, 0.5–0.7 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or convolute (upper), 20–50 cm long, 3–5 mm wide. Leaf-blade surface scabrous, rough on both sides or adaxially, glabrous or pilose, hairless throughout or except near base, moderately hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 11–35(–40) cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1–1.8(–2.5) mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, (16–)20–33 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex setaceously acuminate, awned. Upper glume lanceolate, 14 mm long or 6–28 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate, awned.

Florets. Fertile lemma subterete, (6–)8–12 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous or scaberulous (rarely), rough above (upper 2/3), without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight or flexuous, twisted together or ascending, simple at base, with 25–55 mm long limb, with twisted column. Column of lemma awn (20–)25–60(–95) mm long. Lateral lemma awns present, ascending or wrapped around principal, 22–48 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Western South America, Brazil, Southern South America. Belize, El Salvador, Honduras. Bolivia, Colombia, Ecuador, Peru. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South. Paraguay, Uruguay.

Derivation (Clifford & Bostock 2007): from Mendoza, Chile.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–200 cm long, 2–6 -noded. Lateral branches sparse. Leaf-sheaths mostly shorter than adjacent culm internode. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades curled, flat or convolute, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 7–11 mm long, 2–2.3 length of upper glume, membranous. Lower glume apex acute. Upper glume linear, 3–5 mm long, membranous. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 7–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 17–30 mm long limb. Lateral lemma awns present, 14–27 mm long, subequal to principal.

Flower and Fruit. Caryopsis with adherent pericarp, fusiform, without sulcus, dark brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil Northeast. Argentina Northeast, Argentina South, Paraguay.

TYPE from Indonesia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Jaheri s.n.*, 4 Apr 1901, Indonesia: New Guinea, Irian Jaya, Merauke (L-933.48–142; IT: BO).

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–120 cm long, 1 mm diam. Lateral branches lacking. Leaf-sheaths scaberulous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 7–40 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, 10–20 cm long. Primary panicle branches ascending or spreading, 2–3 -nate, 4–9 cm long. Panicle axis scabrous. Panicle branches capillary, flexuous, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 7–8 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 10–12 mm long, 1.4–1.7 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex attenuate, awned, 1 -awned, awn 1.5 mm long.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, recurved at base of limb, with 30 mm long limb, with twisted column. Column of lemma awn 12–13 mm long. Lateral lemma awns present, spreading less than principal, 25 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia, Papuasias. New Guinea PNG, or West Papua (Irian Jaya). New Guinea.

Aristida meridionalis Henrard. *Meded. Herb. Leid. No. 54 A. 344* (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M.K. Dinter 2476*, Jan 1912, Namibia: Tsumeb (L-922.258–618).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. meridies*, meridian; -*ale*, pertaining to. On the same meridian as a related species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous or woolly. Culms erect, 100–200 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades involute, 25–50 cm long, 2–5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, nodding, 40–80 cm long. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–2 mm long, pilose, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 0.5 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume margins ciliolate. Lower glume apex emarginate or obtuse. Upper glume lanceolate, 10–15 mm long, 1.4–1.6 length of adjacent fertile lemma, scarious, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma elliptic, subterete, 7–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 40–50 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 5–15(–18) mm long. Lateral lemma awns present, 40–50 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West-Central Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. DRC. Tanzania. Angola, Mozambique, Zambia, Zimbabwe. Namibia, Botswana, Limpopo, North-West, Gauteng, Mpumalanga, Free State, Northern Cape.

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: C.G. Pringle 6408, 2 Sep 1896, Mexico: Distrito Federal: sandy fields near Tlalpam, 7300 ft (L-926.134–806; IT: GH, US-287869, US-820675, US-745670).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating origin. From Mexico.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 15–30 cm long. Culm-internodes distally pubescent. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, scaberulous. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades conduplicate, 10–20 cm long, 1–2 mm wide, glaucous. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle pubescent above. Panicle open, ovate, effuse, 30 cm long, 20 cm wide, with spikelets clustered towards branch tips. Primary panicle branches spreading, distant, 1 -nate, rebranched near base, 5–10 cm long. Panicle axis pubescent. Panicle branches scabrous, pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 13 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 1 mm long. Upper glume linear, 12 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma apex acuminate, awned, 3 -awned. Principal lemma awn 3-branched, with 15–17 mm long limb, persistent. Lateral lemma awns present, 15–17 mm long, subequal to principal.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico.

Distrito Federal, Mexico State, Puebla. Aguascalientes, Guanajuato. Jalisco.

Aristida migiurtina Chiov. *Pl. Nov. Aethiop.* 29 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Somalia settentrionale: Costa dei Migiurtini, spiaggia e duna di Hafun, 30 Jan 1924, *Puccioni & Stefanini* 8 (FT holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. from Migiurtini, Somalia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 9–20 cm long, with 0.1–0.33 of their length below uppermost node. Ligule a fringe of hairs. Leaf-blades curled, involute, 2–15 cm long, 1–2 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or elliptic, 7–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 0.75–1 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–13 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–2 mm long. Upper glume linear, 12–22 mm long, 3–4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 4.5–5.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 65–80 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 15–20 mm long. Lateral lemma awns present, 50–60 mm long, shorter than principal. Palea 0.33 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Somalia. Arabian Peninsula. Oman.

Aristida minutiflora Caro. *Kurtziana* 1: 151 (1961).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Caro 2949*, 15 Jan 1959, Argentina: Csrdoaba: Depto. Colsn: La Estancita, a mas o menos 17 km de Rmo Ceballos, (CORD).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (36).

Derivation (Clifford & Bostock 2007): L. *minutus*, very small; *flos*, flower. Spikelets or florets very small.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal, flabellate. Culms 20–30 cm long, 1–2 -noded. Culm-internodes scaberulous. Culm-nodes glabrous. Leaf-sheaths smooth or scaberulous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 2.5–7 cm long, 0.5 mm wide. Leaf-blade venation comprising 7–9 vascular bundles. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 6–13 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4.5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume linear, 3–5 mm long, 0.66–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume linear, 4.5–6 mm long, membranous, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, laterally compressed, 4.5–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 7–15 mm long limb. Lateral lemma awns present, 6–13 mm long, shorter than principal. Palea 0.75–1 mm long.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, linear, without sulcus, 4–6 mm long, light brown. Hilum curved.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast. Catamarca, Mendoza, Santiago del Estero. Cordoba, La Pampa.

Aristida mohrii Nash. *Bull. N. York Bot. Gard.* 1: 436. (1900).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Mohr s.n.*, 1888, USA: Alabama: Mobile Co.: Springs Hill, on sandy ridges (NY-345850; IT: L (fragm. ex US), US-82311, US-81195). Protologue cites collection date as 4 Oct 1886.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (339).

Derivation (Clifford & Bostock 2007): in honor Charles Theodore Mohr (1824–1901) German-born, United States pharmacist and plant collector.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 40–60 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat or involute, 10–15 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially, pilose, hairy adaxially. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 15–30 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 2–3 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, muticous. Upper glume linear, 10 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma linear, subterete, 8 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn recurved at base of limb, with 15–20 mm long limb. Lateral lemma awns present, spreading as much as principal, 15–20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, South Carolina.

Aristida mollissima Pilger. *Engl. Jahrb.* 40: 80 (1908).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Botswana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Schultze 342*, Jan 1905, Botswana: between Senuma (Sekoma?) and Kooa (Kooi?) (B; IT: PRE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. molle*, soft; *-issima*, most. Plant in whole or in part densely covered with soft hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pubescent or woolly. Culms 60–90 cm long. Culm-internodes distally pubescent or woolly. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades filiform or linear, 20–30 cm long, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 10–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–2.5 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–10 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–5 mm long. Upper glume lanceolate, 12–20 mm long, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–5 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–10 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 28–55 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 12–27 mm long. Lateral lemma awns present, 28–55 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa, Southern Africa. Kenya. Mozambique, Zimbabwe. Namibia, Botswana, Limpopo, North-West, Mpumalanga, Free State, Northern Cape.

Aristida monticola Henrard. *Meded. Herb. Leid.* No. 54 A. 355 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Mogg H 20634*, 20 Apr 1919, South Africa: Natal: Mount Aux Sources (K; IT: PRE).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. mons*, mountain; *-cola*, dweller. Growing on mountains.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms decumbent, 35–70 cm long, wiry, without nodal roots or rooting from lower nodes. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches ample. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades flat or convolute, 6–12 cm long, 1–2 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 7–14 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8.5 mm long, 1.2–1.4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume lanceolate, 5–6 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 6–6.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate, awned, 3 -awned. Principal lemma awn straight or 3-branched, with 18 mm long limb, without a column or with twisted column, persistent. Lateral lemma awns present, 13 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Free State, Kwazulu-Natal.

Aristida moritzii *Aristida moritzii*. Meded. Herb. Leid. No.54 A. 356 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.W.K. Moritz 1522*, 1844, Venezuela: Zulia: Maracaibo (B; IT: US-81194 (fragm. ex B & photo)).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (33, Fig. 17).

Derivation (Clifford & Bostock 2007): in honor of Moritz (-) who collected in Venezuela.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long. Culm-internodes smooth or scaberulous. Lateral branches sparse. Leaf-sheaths mostly shorter than adjacent culm internode, striately veined, smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades conduplicate or involute, 15–20 cm long, 1–2 mm wide, glaucous. Leaf-blade surface scabrous, rough adaxially, pubescent, hairy adaxially. Leaf-blade margins cartilaginous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle open, linear, interrupted, 10–20 cm long, 0.5–1 cm wide. Primary panicle branches appressed, 1–2 -nate. Panicle axis scaberulous. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, bearded, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10–11 mm long, 0.95 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex setaceously acuminate. Upper glume linear, 11–12 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume surface smooth. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 8–9 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 30–35 mm long limb. Lateral lemma awns present, 30–35 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

Aristida multiramea Hackel. *An. Mus. Nac. Buenos Aires* 21: 67 (1911).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Stuckert 16807 [remitido por M. Estrada]*, 12 Jan 1907, Argentina: Csrdo: Capilla del Monte, Dep. Punilla (W; ILT: CORD, US-81192 (fragm.)). LT designated by Henrard, *Meded. Rijks-Herb.* 54(A): 364 (1927); the collection number is erroneously cited as 16806 in the protologue.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. multus*, many; *ramus*, branch. Culms much branched.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal or intravaginal. Culms erect, 25–30 cm long, 2–4 -noded. Culm-nodes glabrous. Lateral branches fastigiate, arising from lower culm or mid culm. Leaf-sheaths smooth, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Collar glabrous. Leaf-blades filiform, convolute, 2–12 cm long, 0.4–0.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, continuous or interrupted, 4–10 cm long, bearing few spikelets. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, angular, smooth.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 6–9 mm long, 0.66 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, mucronate. Upper glume linear, 9–12 mm long, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 8–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 8–20 mm long limb. Lateral lemma awns present, gyrate, 6–18 mm long, shorter than principal. Palea 1 mm long.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus, 8–8.5 mm long, dark brown. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast. San Luis. Buenos Aires, Cordoba, Distrito Federal, La Pampa.

Aristida muricata Henrard. *Meded. Herb. Leid.* No. 58 A. 286 (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *W.D. Brown 63*, Jun 1913, Australia: New South Wales, Golun (L-932.55–106 (photo, BRI); IT: BRI (fragm.), K, NSW). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 729 (1933).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (130), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 182, Fig.8 (1992)).

Derivation (Clifford & Bostock 2007): *L. rough*. Glumes bear short hard points.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 50–90 cm long. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs, 1 mm long. Collar glabrous or pubescent. Leaf-blades involute, 9–19 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, 17–30 cm long, 1–8 cm wide. Primary panicle branches 2.5–10 cm long, naked below or bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–12 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 8–12 mm long, 1.1–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex emarginate or obtuse or acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 7.5–8.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins involute, covering most of palea, scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn subterete below or flat below, with 17–30 mm long limb, without a column, persistent. Lateral lemma awns present, 15–28 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland.
North, Central, South East, Inland. Western Slopes, Western Plains.

TYPE from South America. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Habitat in Mindonas insula peope Sambonyan, floretque Decembri, (HT: MA) Erroneously described as originating in the Philippines, it is actually a South American species, *fide* Henrard, *Meded, Rijks-Herb.* 54(A): 255–428 (1927)

Illustrations (Books): A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (214, Fig. 78), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (478, Fig. 320), B.Rosengurt, *Gramineas Uruguayas I* (1970), F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (37).

Derivation (Clifford & Bostock 2007): *L. murus*, wall; *-ina*, belonging to. Growing on walls.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 25–50(–76) cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded (deciduous). Ligule a fringe of hairs, 0.3 mm long. Collar glabrous. Leaf-blades straight or curved, conduplicate, 10–25(–30) cm long, 1.5–3 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, 9–15(–18) cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.8–1 mm long, pilose, acute (or subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 1–18 mm long, 1(–3) -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex dentate (sometimes), 2 -fid (sometimes), acute or acuminate, muticous or awned (shortly). Upper glume lanceolate, 20–35 mm long, 1 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex entire, acute or acuminate.

Florets. Fertile lemma laterally compressed (slightly), 13–15(–17) mm long, keeled, lightly keeled, keeled above, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface smooth, without

grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 55–105 mm long limb, without a column. Lateral lemma awns present, ascending, 55–105 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast. Argentina Northeast, Uruguay.

Sao Paulo Parana. Buenos Aires, Cordoba, Distrito Federal, Entre Rios.

Aristida mutabilis Trin. & Rupr. Mem. Acad. Petersb. Ser. 6, 7: 150. (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Sudan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Kotschy 103*, Sudan: Cordofan, in arenae saxi graniticis delitescantibus formata (LE; ILT: K, L). LT designated by Henrard, *Meded. Rijks-Herb.* 54(A): 367 (1927); cited (as type) by Chaudhary, *Grass. Saudi Arabia* 216 (1989); cited by van der Zon, *Gram. Cameroun* 2: 101 (1992).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (85, Fig. 35), L.Boulos, *Flora of Egypt* 4 (2005) (239, Pl. 70).

Derivation (Clifford & Bostock 2007): *L. changeable*. Variable in accord with the season or habitat.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms (10–)30–70 cm long. Culm-internodes distally glabrous. Leaf-sheath oral hairs lacking or bearded. Ligule a fringe of hairs. Leaf-blades flat or convolute, 6–14 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, 10–20 cm long, with spikelets clustered towards branch tips. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–5 mm long, 0.7–1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 6–7 mm long, 1.4–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume mucronate or mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–30 mm long limb, with twisted column, deciduous, abscissing from top of column, limb scabrous. Column of lemma awn 2–5 mm long. Lateral lemma awns present, 10–30 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

$n = 11$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Northern Africa, West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Algeria, Egypt, Libya, Western Sahara. Ghana, Mali, Mauritania, Nigeria, Senegal, Niger. Eritrea, Ethiopia (inc. Eritrea), Somalia, Sudan. Kenya, Tanzania, Uganda. Western Asia, Arabian Peninsula. Iran. Gulf States, Oman, Saudi Arabia. Indian Subcontinent. India, Pakistan, West Himalaya.

Punjab, Rajasthan, Tamilnadu.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman s.n.*, 12 Feb 1921, Cuba: La Habana: Guanabacoa, on grassy hills called Lomas de las Jatas (US-1064517; IT: L, L (fragm. ex US), NY-39632, NY-7100, NY-39633). NYBG specimen notes: See also NY 39632, 39633, 71000. "This specimen should be cited, 'Amer. Gr. Nat. Herb. no. 783'".

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. negligo*, disregard. Often a segregate from another species with which confusion is likely.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 40–60 cm long, wiry. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2–0.5 mm long. Leaf-blades filiform, involute, 2–5 cm long, 0.5–1 mm wide, stiff. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 5–10 cm long. Primary panicle branches ascending, 1–2 cm long. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume linear, 7–9 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate or setaceously acuminate. Upper glume linear, 7–9 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb, with twisted column. Column of lemma awn 3–4 mm long. Lateral lemma awns present, spreading less than principal, 10–15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Dominican Republic, Haiti.

Aristida nemorivaga Henrard. *Meded. Herb. Leid.* No. 54 A. 376 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Angola. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Open forest between Huilla and Quihila mission, 13 Apr 1909, *H.H.W. Pearson 2634* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. nemus*, wood; *vagus*, wandering. Growing in open woodlands.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long, 4 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades curled, 10–20 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins cartilaginous, scabrous.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, elliptic, interrupted, 10–20 cm long, with spikelets clustered towards branch tips. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–8 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex emarginate or obtuse, mucronate. Upper glume lanceolate, 8–11 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or truncate, mucronate.

Florets. Fertile lemma elliptic, subterete, 7–11 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 9–15 mm long limb, persistent. Lateral lemma awns present, 7–13 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa and Southern Africa. Angola.

Aristida nicorae Sulekic. *Darwiniana* 41(1–4): 175 (-177; fig. 8). 2003 (2003).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Quebrada de Las Conchas: Sulekic & Cano 3260 (SI holo, US, W).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (38).

Illustrations (Journals): *Darwiniana* (41: 176, fig.8 (2003)).

Derivation (Clifford & Bostock 2007): in honor of Elisa Gernacla Nicora de Panza (1912-) Argentinian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect, 70–110 cm long, 6–9 -noded, disarticulating at the nodes. Culm-internodes terete, solid, distally glabrous. Lateral branches ample. Leaf-sheaths striately veined, smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 2–3 mm long. Ligule a fringe of hairs, 0.5–0.6 mm long. Leaf-blades straight or curved, convolute, 2–20 cm long, 0.5–2 mm wide. Leaf-blade venation prominent. Leaf-blade surface scaberulous, rough adaxially or on both sides. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–20 cm long. Panicle axis smooth or with occasional prickles. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, angular, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6.5–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.6 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13 mm long, 0.75–1.1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex entire or dentate, 2 -fid, acute, mucous or mucronate. Upper glume lanceolate, 8–13 mm long, 1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 8.5–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 10–22 mm long limb. Lateral lemma awns present, ascending, 8.5–18 mm long, shorter than principal. Palea 1.3–1.7 mm long, 2 -veined. Palea apex entire or dentate, 2 -fid.

Flower and Fruit. Lodicules 2, 1.2–1.5 mm long. Anthers 3, 1.5–2.5 mm long. Caryopsis with adherent pericarp, fusiform, without sulcus, 6.5–9 mm long, dark brown. Embryo 0.33–0.5 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast.

Jujuy, Salta, Tucuman.

Aristida niederleinii Mez. Fedde, *Repert.* 17 : 150 (1921).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *G. Hieronymus* 167, 13 Jan 1876, Argentina: Córdoba: entre San Ignacio y San Josi al lado del Oeste de la Sierra Chica de Córdoba (US-81190). LT designated by Caro, *Kurtziana* 1: 178 (1961). ST: *Niederlein s.n.*, Argentina: Misiones.

Illustrations (Books): A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (213, Fig 77).

Derivation (Clifford & Bostock 2007): in honor of Gustav Niederlein (1858–1924) German botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal, flabellate. Culms erect, 11–24 cm long, 1–2 -noded. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths wider than blade at the collar, scaberulous. Leaf-sheath oral hairs bearded, deciduous, 2.5–3.5 mm long. Ligule a fringe of hairs. Collar glabrous. Leaf-blades filiform, convolute, 13.5–33 cm long, 0.5 mm wide, stiff. Leaf-blade surface ribbed, scabrous, rough on both sides. Leaf-blade margins scaberulous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle, comprising 6–18 fertile spikelets. Panicle contracted, oblong, 5–17 cm long, bearing few spikelets. Primary panicle branches bearing 2–3 fertile spikelets on each lower branch. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, angular, scaberulous, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 28–40 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 15–25 mm long, 0.5–0.66 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous, rough above. Lower glume apex acute, awned, 1 -awned, awn 2–4 mm long. Upper glume linear, 24–40 mm long, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acute, awned, 1 -awned, awn 4–8 mm long.

Florets. Fertile lemma linear, subterete, 12.5–14 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 105–145 mm long limb. Lateral lemma awns present, 95–136 mm long, shorter than principal. Palea 1.5 mm long.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus, 9–10 mm long, light brown. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast.

San Luis. Buenos Aires, Córdoba, Corrientes, Entre Rios, La Pampa, Misiones.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. niteo*, shine; *-ula*, exhibiting tendency. Spikelets glossy.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 35–82 cm long, 1 mm diam., 1 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking. Leaf-sheaths antrorsely scabrous. Leaf-sheath oral hairs bearded, 3–4 mm long. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous. Leaf-blades involute, 12–17 cm long, 0.7–1 mm wide. Leaf-blade surface scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 17–28 cm long, 0.5–2 cm wide. Primary panicle branches 2–4 cm long, bearing spikelets almost to the base. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6.3–10.6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.3–1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.3–10.6 mm long, 1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute to setaceously acuminate. Upper glume lanceolate, 6.2–9.6 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex obtuse, mucicous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 6–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, flat below, with 8–27 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 7–24 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.1–1.4 mm long. Caryopsis with adherent pericarp, 4.6–6 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. **Australia.** New South Wales, Northern Territory, Queensland, South Australia, Western Australia.

Aristida novae-caledoniae Henrard. *Meded. Herb. Leid.* No. 54 A. 383 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, W.D.Clayton & N.Snow, Key to Pacific Grasses (2010).

TYPE from New Caledonia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *B. Balansa 3083*, May 1871, New Caledonia: Poume Mt. (L-908.83–890–893–1201).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): From New Caledonia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 25–50 cm long. Culm-internodes smooth, distally glabrous. Culm-nodes swollen. Lateral branches sparse. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades erect, filiform, involute, 15–20 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–10 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 8–16 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–6 mm long, 0.66 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate. Upper glume lanceolate, 8–9 mm long, 1.2

length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, reflexed, with 15 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 3 mm long. Lateral lemma awns present, spreading less than principal, 10 mm long, shorter than principal. Palea 0.1 length of lemma.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Pacific.

Country /Province /State. Southwestern Pacific. New Caledonia.

Aristida novae-guineae Ohwi. *Bot. Mag., Tokyo*, 56: 2 (1942).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. dark. Spikelets dark-colored.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 25–40 cm long. Culm-internodes smooth, distally pubescent. Lateral branches ample. Leaf-sheaths antrorsely scabrous, pubescent. Leaf-sheath oral hairs bearded, 3 mm long. Ligule a fringe of hairs, 0.5 mm long. Collar pilose. Leaf-blades 10–25 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough adaxially, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle elliptic in section. Panicle open, ovate, loose, 7–15 cm long, 5–10 cm wide. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13–21 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–15 mm long, 0.4–0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous or scabrous. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1–3 mm long. Upper glume lanceolate, 13–21 mm long, 1.5–1.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper

glume surface asperulous or scabrous. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1–3 mm long.

Florets. Fertile lemma lanceolate, subterete, 11–14 mm long, coriaceous, purple, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough generally. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 15–40 mm long limb, without a column, persistent. Lateral lemma awns present, 23–38 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 6–10 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. **Australia.** New South Wales, Northern Territory, Queensland, South Australia, Western Australia.

Ereman. Central Australia. NW & Lake Eyre. South East, Inland. Western Slopes, Western Plains.

Aristida oligantha Michx. *Fl. Br. Am.* 1: 41. (1803).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Michaux s.n.*, In apricis pratensibus regionis Illinoensium, route de Illinois au fort Massar, lieux alternatium submergen (P; IT: US-81184 (fragm. ex P & photo)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (327), F.W.Gould, *The Grasses of Texas* (1975) (386, Fig. 204), E.Hafliger & E.Schultz, *Grass Weeds*, CIBA-GEIGY (2:20(1980)).

Derivation (Clifford & Bostock 2007): Gk. *oligos*, few; *anthos*, flower. Inflorescence of few spikelets.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 15–88 cm long, wiry. Culm-internodes distally glabrous. Lateral branches ample. Leaf-sheaths without keel, glabrous on surface. Leaf-sheath oral hairs lacking or pubescent. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades filiform, 10–25 cm long, 1–2 mm wide. Leaf-blade surface glabrous or hispid, sparsely hairy. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 5–14 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets sessile. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 18–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 18–25 mm long, 1 length of upper glume, membranous, 3–7 -veined. Lower glume apex acuminate, muticous or awned, 1 -awned, awn 0.5 mm long. Upper glume lanceolate, 18–25 mm long, 1.1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, acute, awned, 1 -awned, awn 10–15 mm long.

Florets. Fertile lemma linear, subterete, 16–28 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 30–70 mm long limb, without a column. Lateral lemma awns present, spreading as much as principal, 30–70 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Europe (*), North America.

Aristida oligospira (Hack.) Henrard. *Meded. Herb. Leid.* No. 54, 160 (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Paraguay. **Basionym or Replaced Name:** *Aristida riparia* var. *oligospira* Hack., *Bull. Herb. Boiss.* ser.2, 4:277 (1904). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Hassler* 3825, Jan, Paraguay: in palude Tucangua (W; IST: MO, US-2947077 (fragm. ex W & photo)).

LT: *Hassler* 8321, Dec 1901–1902, Paraguay: in campis in regione cursus superiores fluminis Apa (G; ILT: K, MO, NY, P, S, W). LT designated by Longhi-Wagner, *Bol. Inst. Bot. (Sao Paulo)* 12: 141 (1999).

LT: *L.R. Parodi* 2835, 1919, Argentina borealis: Gobernacion de Formosa: in campis altis (L-925.260–295). LT designated (as typus) by Henrard, *Meded. Rijks-Herb.* 54(A): 392 (1927), but incorrectly as he did not choose from among the syntypes of *Aristida riparia* var. *oligospira* Hack., the basionym of Henrard's combination.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *oligos*, few; *spira*, spiral. Column of awn with few twists.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 70–110(–140) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs or a ciliolate membrane (rarely), 0.2 mm long. Collar glabrous. Leaf-blades straight, conduplicate, 30–80 cm long, 3–4 mm wide. Leaf-blade surface scabrous (densely), rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, (13–)15–27 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.2–0.3 mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower longer than upper sometimes subequal). Lower glume lanceolate, 12–15 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 11–13 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 6–7 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface papillose, rough above, with a median groove (ventral,longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn flexuous, reflexed or twisted together, simple at base, with 22–32 mm long limb, with twisted column. Column of lemma awn 7–12 mm long. Lateral lemma awns present, wrapped around principal (or reflexed), 19–27 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Northeast, Brazil Southeast. Paraguay.

Formosa.

Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (39).

Derivation (Clifford & Bostock 2007): *L. pale*. Inflorescences pale.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 28–50 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or scanty. Ligule an eciliate membrane, 0.6–0.8 mm long. Collar glabrous. Leaf-blades straight, convolute, 8–14(–16) cm long, 0.5–0.9 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, hairless except near base, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open (erect,subcontracted), 14–16(–20) cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.4–0.5(–0.6) mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 12–20(–27) mm long, 1 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 28–37(–40) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 11–12 mm long, without keel, rounded except near apex, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 65–100 mm long limb, without a column. Lateral lemma awns present, ascending, 65–100 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Colombia. Brazil Southeast, Brazil South. Argentina Northeast, Argentina South, Chile Central, Paraguay, Uruguay.

TYPE from USA. **Basionym or Replaced Name:** *Aristida virgata* var. *palustris* Chapm., *Fl. South. US* :555 (1860). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IST: A.W. Chapman s.n., no date, USA: Florida (US-966075).

Aristida virgatus Trin., Spreng. *Neue Entdeck.* 2: 60. (1821).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (339).

Derivation (Clifford & Bostock 2007): *L.* swampy place. Growing in swampy places.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms erect, 100–150 cm long. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs. Leaf-blades flat, 15–30 cm long, 2–3 mm wide. Leaf-blade surface puberulous, hairy adaxially. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 25–50 cm long. Primary panicle branches appressed, 5–10 cm long, naked below or bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 12 mm long, 1 length of upper glume, membranous, 2 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous. Lower glume apex acute, mucronate. Upper glume linear, 12 mm long,

membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, mucronate.

Florets. Fertile lemma linear, subterete, 8 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1 mm long, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 15–30 mm long limb. Lateral lemma awns present, spreading less than principal, 10–25 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. **South-central USA, Southeastern USA.** Texas. Alabama, Arkansas, Florida, Georgia, Mississippi, North Carolina, South Carolina.

Aristida pansa Wooton & Standl. *Contrib. US. Nat. Herb.* 16: 112 (1913).

TYPE from USA. T:<Type of Basionym>; *vide* TROPICOS and Kew Synonymy Database: HT: *E.O. Wooton s.n.*, 6 Oct 1904, USA: New Mexico: Dona Ana Co.: Tortugas Mountain, near Las Cruces (US-690259; IT: L (fragm. ex US), NMC).

Recent Synonyms: *Aristida tehuacanensis* Sanchez-Ken & Davila, *Fl. Valle Tehuacan-Cuicatlan* 3: 18, f. 1 (1994).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (327), F.W.Gould, *The Grasses of Texas* (1975) (396, Fig. 210).

Derivation (Clifford & Bostock 2007): L. extended. Inflorescence branches very long.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous or pubescent. Culms erect, 20–50 cm long, wiry. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat or involute, 5–15 cm long, 0.7–1.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 10–20 cm long. Primary panicle branches appressed or ascending, 2–8 cm long. Panicle branches with insignificant pulvini. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 0.6–0.75 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 7–12 mm long, 1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, ascending or spreading, with 10–20 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2 mm long. Lateral lemma awns present, spreading as much as principal, 10–20 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. **Southwestern USA, South-central USA, and Mexico.** Arizona. New Mexico. Central Mexico, Northeast Mexico, Southwest Mexico, Southeast Mexico.

Puebla. Coahuila, Chihuahua, Durango, Guanajuato, Hidalgo, Neuvo Leon, Queretaro, San Luis Potosi, Tamaulipas, Zacatecas. Jalisco, Oaxaca. Quintana Roo.

Aristida paoliana (Chiov.) Henrard. *Meded. Herb. Leid.* No. 54 A. 420 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. **Basionym or Replaced Name:** *Aristida hemmingii* Clayton, *Kew Bull.* 23: 211 (1969). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Paoli 115, 26 Mar 1913, Somalia: Mogadishu, Boscaglia di Morgadiscio lungo la strada di Afgoi fra il 4 e il 5 km (FI).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (83, Fig 34).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of G. Paoli (fl. 1913) who collected in Somaliland.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–40 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades flat or convolute, 5–20 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or ovate, 8–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–5(–6) mm long, 0.4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex lobed, 2 -fid, obtuse, mucronate. Upper glume linear, 10–12 mm long, 2–2.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex lobed, 2 -fid, mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–50 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 8–15 mm long. Lateral lemma awns present, 30–40 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea), Somalia. Kenya.

Aristida papuana J.F. Veldkamp. *Blumea*, 37(1): 228 (1992).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, *Poaceae* ms (*Flora Malesiana*).

TYPE from New Guinea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.E. Henty & D.B. Foreman 49315*, 8 Nov 1972, Papua New Guinea: New Guinea, Western, Morehead Patrol Post (L). IT: A, BRI, CANB, E, K, LAE, M.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Papua, now Papua New Guinea.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 25–45 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades 7–12.5 cm long, 0.5–1.7 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–13 cm long, 4 cm wide, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1–1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–7 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 1(–3) -veined. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate or awned, 1 -awned, awn 0.5–1 mm long. Upper glume lanceolate, 10–12 mm long, 1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate or awned, 1 -awned, awn 0.8–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 30 mm long limb, with twisted column, persistent. Column of lemma awn 5.5–8 mm long. Lateral lemma awns present, 30 mm long, subequal to principal.

Flower and Fruit. Anthers 3, 1.25 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia, Papuasia. New Guinea PNG. New Guinea.

Aristida parishii Hitchcock. Jepson, *Fl. Calif* 1: 101 (1912).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *S.B. Parish & W.F. Parish 1029A*, Apr 1882, USA: California: San Bernardino Co.: Agua Caliente, Colorado Desert (US-81172; IT: L (fragm. ex US)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Samuel Bonsall Parish (1838–1928) United States botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long. Lateral branches lacking. Leaves basal and cauline. Ligule a fringe of hairs. Leaf-blades involute, 10–20 cm long, 1–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, 10–25 cm long. Primary panicle branches appressed, 4–8 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 8–16 mm long, 0.5–0.66 length of upper glume, membranous. Lower glume primary vein scabrous. Lower glume apex entire or dentate, 2 -fid, acute, awned, 1 -awned. Upper glume linear, 12–18 mm long, membranous. Upper glume primary vein smooth. Upper glume apex entire or dentate, 2 -fid, acute, awned, 1 -awned.

Florets. Fertile lemma linear, subterete, 12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 15–35 mm long limb, with a straight or slightly twisted column. Column of lemma awn 10–15 mm long. Lateral lemma awns present, spreading as much as principal, 15–35 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southwestern USA. California.

Aristida parodii Henrard. *Meded. Herb. Leid.* No. 54 A. 428 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *S. Venturi 1129*, Mar 1917, Argentina: Tucuman (L-925.70–84; IT: BAA, US-81171 (fragm. ex L)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (40).

Illustrations (Journals): *Darwiniana* (41: 179, fig.9 (2003)).

Derivation (Clifford & Bostock 2007): in honor of Lorenzo Raimondo Parodi (1895–1966) Argentinian agrostologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–60 cm long. Culm-internodes smooth. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface.

Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades convolute, 20–30 cm long, 2 mm wide. Leaf-blade surface smooth, glabrous. Leaf-blade margins smooth. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, 25 cm long. Primary panicle branches 1–2 -nate, 7–15 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, truncate.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, 0.9 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 8–8.5 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, laterally compressed, 8–8.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface granulose. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, awned, 3 -awned. Principal lemma awn 3-branched, with 14 mm long limb. Lateral lemma awns present, 10–11 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Southern South America. Bolivia. Argentina Northeast.

Jujuy, Salta, Tucuman.

Aristida parvula (Nees) de Winter. *Kirkia* 3: 132 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. **Basionym or Replaced Name:** *Stipa parvula* Nees, *Fl. Afr. Austr.* 169. (1841). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Klein Namaqualand*, "In collibus saxosis siccis deserti Karro ..." ST: *Drege*, "..., prope Verleptpraam et ad ostia Garip fluvii...".

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (290, Fig 261 as *Stipa*).

Derivation (Clifford & Bostock 2007): *L. parvus*, small; -ula, diminutive. Dwarf in habit.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 6–40 cm long, wiry. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking or sparse or ample. Leaf-sheaths outer margin hairy. Ligule a fringe of hairs. Leaf-blades flat or convolute, 6–12 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 4–12 cm long. Primary panicle branches spreading. Panicle branches angular, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6.5–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, hairy in a ring above, truncate. Floret callus hairs 0.5 length of lemma.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–5.5 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 2 mm long. Upper glume lanceolate, 6.5–7.5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2 mm long.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1 -awned. Principal lemma awn geniculate, with 6–9 mm long limb, with

twisted column, deciduous, abscising from top of lemma. Column of lemma awn 5 mm long. Lateral lemma awns absent. Palea oblong, 1 mm long, 0.15 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 2, lanceolate, 1.5 mm long, fleshy, veined. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp, linear. Embryo 0.5 length of caryopsis. Hilum linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Namibia, Northern Cape.

Aristida patula Chapm. ex Nash. *Bull. Torr. Bot. Cl.* 23: 98 (1896).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Chapman s.n.*, 1875, USA: Florida (US). ST: *Chapman 79*, 1884, USA: Florida (US, W-15951).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (322).

Derivation (Clifford & Bostock 2007): L. outspread. Inflorescence an open panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Culms erect, 50–100 cm long. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat or involute, 25–50 cm long, 2–4 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 20–35 cm long, 0.33–0.5 of culm length, with spikelets clustered towards branch tips. Primary panicle branches drooping, 1–2 -nate, rebranched at middle, 10–20 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 12–15 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear, 12–15 mm long, 1.2 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 10–12 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn ascending, with 20–25 mm long limb. Lateral lemma awns present, ascending, 5–10 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida.

Aristida pedroensis Henrard. *Meded. Herb. Leid.* No. 58 A. 232 (1932).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *L.R. Parodi 9784*, 19 Feb 1931, Argentina: Jujuy: Depto. San Pedro: camino a San Pedro (L-931.349–12; ILT: BAA, US-1502424). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 731 (1933).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *ensis*, denoting origin. From Depto. San Pedro, Argentina.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 80–130 cm long, 2.5–3 mm diam., 4–5 -noded. Culm-internodes similar in length, distally glabrous. Culm-nodes swollen. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, scaberulous. Leaf-sheath oral hairs scanty or lacking. Ligule a fringe of hairs. Leaf-blades involute, 40–60 cm long, 2–3 mm wide. Leaf-blade

venation with 6 secondary veins. Leaf-blade surface scabrous, rough on both sides. Leaf-blade margins cartilaginous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear. Primary panicle branches appressed, distant. Panicle axis scaberulous, glabrous or puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10 mm long, 0.75 length of upper glume, membranous, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume surface pubescent, hairy in lines. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 3–4 mm long. Upper glume linear, 12–14 mm long, 3–4 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 4–5 mm long.

Florets. Fertile lemma linear, subterete, 3–4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 30 mm long limb, with twisted column. Column of lemma awn 10 mm long. Lateral lemma awns present, 30 mm long, subequal to principal. Palea hyaline, 0 -veined.

Flower and Fruit. Lodicules 2. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast, Argentina Northwest. Jujuy.

Aristida pendula H.M. Longhi-Wagner. *Bradea* 5(5): 59 (1988).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Minas Gerais: Grco Mogol - Cristalina, 15 Apr 1981, *Cordeiro, J.R. Pirani, M.C.E. Amaral, L. Rossi & A. Furlan CFCR 963* (HT: SPF; IT: ICN, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pendulus*, hanging down. Spikelets or inflorescence branches pendant.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 100–120(–150) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded (hairs extending to an initial collar). Ligule a fringe of hairs, 1–1.5 mm long. Collar glabrous. Leaf-blades straight or flexuous (slightly), flat (lower) or convolute (upper), 18–43(–50) cm long, 3–3.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 30–35 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower slightly shorter or longer than upper sometimes subequal). Lower glume lanceolate, 7–8.5 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acute. Upper glume lanceolate, 8–10 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex dentate, 2 -fid, setaceously acuminate, mucronate.

Florets. Fertile lemma subterete, 9–11 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth, with a median groove (ventral, longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (19–)20–27 mm long limb, with twisted column. Column of lemma awn (1.5–)2–3 mm long. Lateral lemma awns present, ascending, (15–)19–25 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.
Country /Province /State. Brazil. Brazil Southeast.

Aristida pennei Chiov. *Ann. di Bot. Roma*, 2: 366. (1905).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Eritrea. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: Pappi 1976, 1902, Eritrea: regione Oculi Cusai (FI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Penne (pre 1908).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 2–20 cm long. Ligule a fringe of hairs. Leaf-blades aciculate, involute, 1–10 cm long, 1–2 mm wide, glaucous. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 3–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–10.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6.5–7.5 mm long, 0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, mucicous or awned, 1 -awned, awn 0–1 mm long. Upper glume linear, 9–10.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, flat below, with 17–27 mm long limb, without a column, persistent. Lateral lemma awns present, 17–27 mm long, subequal to principal. Palea 0.25 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Eritrea. Arabian Peninsula. Saudi Arabia, Yemen.

Aristida perniciososa Domin. *Biblioth. Bot.* 1, 5: 340 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: K. Domin *s.n.*, Feb 1910, Australia: Queensland: Cook District: Eucalyptus-Walder bei Mareeba (L (photo, BRI); IT: BRI).

Illustrations (Books): J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(11)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), K.Domin, *Bibliotheca Botanica* 85 (1915) (Pl.13).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 165, Fig.4 (1992)).

Derivation (Clifford & Bostock 2007): L. per, very; noxious, harmful; -osa, abundance. Callus very sharp and readily entangling in wool and clothing.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 40–137 cm long, 1–2 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth or scaberulous, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate, 0.5–2 mm long. Ligule a fringe of hairs, 0.3 mm long. Leaf-blades curled or flexuous, conduplicate or involute, 10–20 cm long, 2–3 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, 15–39 cm long, 1–1.5 cm wide. Primary panicle branches 2-nate, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–18.3 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.8–1.1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11–16 mm long, 0.9–1 length of upper glume, membranous, 1-keeled, 5-veined. Lower glume primary vein scabrous. Lower glume apex acute or acuminate, awned, 1-awned, awn 8 mm long. Upper glume lanceolate, 11–18.3 mm long, 1.3–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume surface glabrous or pubescent. Upper glume apex acute or acuminate, awned, 1-awned, awn 8 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–14 mm long, coriaceous, pallid or light brown, without keel, 3-veined, 0–3-veined. Lemma surface smooth or scaberulous, rough above. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 16–34 mm long limb, with twisted column, persistent. Column of lemma awn 5–10 mm long. Lateral lemma awns present, 13–30 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 0.9–1.3 mm long. Caryopsis with adherent pericarp, sulcate on hilar side, 5.4–7.6 mm long. Hilum linear, 0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia. Kimberley. Darwin & Gulf. North, Central, South East, Inland.

Aristida personata Henrard. *Meded. Herb. Leid.* No. 58, 30 (1932).

Derivation (Clifford & Bostock 2007): L. masked, that is, resembling something else. Readily confused with another species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 60–120 cm long. Culm-internodes smooth, distally glabrous. Lateral branches fastigiate. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous. Leaf-blades involute, 8–16 cm long, 1–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–30 cm long, 1–2 cm wide. Primary panicle branches 2–5 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9.5–11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–11.5 mm long, 1 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute to setaceously acuminate. Upper glume lanceolate, 6–11.5 mm long, 0.6–1 length of adjacent fertile lemma,

membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute to setaceously acuminate.

Florets. Fertile lemma lanceolate, subterete, 9.5–10.5 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness to scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 12–25 mm long limb, without a column, persistent. Lateral lemma awns present, 13–23 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 6–8.5 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland, South Australia. Fiji. Southern. North, Central, South East. Coast, Tablelands, Western Slopes, Western Plains.

Aristida petersonii K.W. Allred & J. Valdes-Reyna. *Novon* 5(3): 209 (1995).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Oaxaca: 7.7 km NW of Tlaxiaco on road to San Juan Mixtepec, steep slopes with Pinus, Quercus, and Arbutus, elev. 2020 m, 2 Sep 1990, P.M. Peterson & A. Campos-Villanueva 9731 (HT: NMCR; IT: ANSM, US).

Illustrations (Journals): *Novon* (5:210, Fig.1 (1995)).

Derivation (Clifford & Bostock 2007): in honor of Paul M. Peterson (b 1923), United States agrostologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Culm-internodes terete, striate, distally glabrous. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, without keel, striately veined, woolly. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades flat or conduplicate, 15–30 cm long, 2–2.5 mm wide. Leaf-blade surface glabrous. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20–30 cm long. Primary panicle branches appressed, 1–2 -nate, 6–12 cm long, bearing 4–8 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 5 mm long, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–13 mm long, 1.5–2 length of upper glume, membranous, light brown or purple, 1 -veined. Lower glume lateral veins absent. Upper glume lanceolate, 6–7 mm long, 1.7–2 length of adjacent fertile lemma, membranous, light brown or purple, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 3–4 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned or 3 -awned. Principal lemma awn geniculate or 3-branched, with 7–9 mm long limb, with twisted column. Column of lemma awn 4–6 mm long. Lateral lemma awns absent or present, 0.1 mm long, shorter than principal. Palea 1–1.5 mm long, hyaline, 2-keeled.

Flower and Fruit. Lodicules 2, 1–1.5 mm long. Anthers 3. Caryopsis with adherent pericarp, fusiform, 4.5–5.5 mm long, dark brown.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico. Oaxaca.

Aristida pilgeri Henrard. *Meded. Herb. Leid.* No. 54 A. 443 (1927).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *M.K. Dinter 2938*, 4 Apr 1913, Namibia: Omaheke (L-925.70–72; IT: B, PRE).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Derivation (Clifford & Bostock 2007): in honor of Robert Knuds Friedrich Pilger (1876–1953) German agrostologist, born on Helgoland before its transfer from British to German administration.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 70–150 cm long, 3–6 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades 20–35 cm long, 1–2 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20–40 cm long, 2–5 cm wide. Primary panicle branches appressed, 1 -nate, 5–11 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–7 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scaberulous. Lower glume surface asperulous. Lower glume apex acute, awned, 1 -awned, awn 1.5–2 mm long. Upper glume lanceolate, 10 mm long, 1.4–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2 mm long.

Florets. Fertile lemma elliptic, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface punctate. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–20 mm long limb, with a straight or slightly twisted column, deciduous, abscissing from top of column. Column of lemma awn 1.5 mm long. Lateral lemma awns present, 10–20 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. **South Tropical Africa, Southern Africa.** Angola, Zambia, Zimbabwe. Namibia, Botswana, Limpopo, North-West, Mpumalanga.

Aristida pilosa Labill. *Sert. N. Caled.* 12. t. 17. (1824).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from New Caledonia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *Labillardiere s.n.*, New Caledonia (P).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pilus*, a hair; *-osa*, abundance. The whole plant or any of its organs invested with long spreading hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–70 cm long. Culm-internodes distally pubescent. Culm-nodes swollen. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades curved, filiform, convolute, 10–20 cm long, 1 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–20 cm long. Primary panicle branches appressed, 2–6 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, clavate, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 6.5 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate, awned, 1 -awned, awn 4 mm long. Upper glume lanceolate, 7.5 mm long, 0.9 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1 mm long.

Florets. Fertile lemma linear, subterete, 8.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface punctate. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 8–9 mm long limb, without a column, persistent. Lateral lemma awns present, spreading less than principal, 4.5–5 mm long, shorter than principal. Palea 0.1 length of lemma.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Pacific.

Country /Province /State. Southwestern Pacific. New Caledonia.

Aristida pinifolia Catasz. *Novosti Sist. Vyssh. Rast.*, 20: 7 (1983).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Isla de la Juventud (Isla del Pinos): sabanas de arenas blancas, 27 Dec 1951, *Alain & Killip 2170* (HT: HAC).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. folium*, leaf. The leaf-blades resemble those of *Pinus*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida pittieri Henrard. *Meded. Herb. Leid.* No. 54 A. 447 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H. Pittier 10803*, 27 Nov 1922, Venezuela: Trujillo: Dividive, in savannas, abundans (G-Del; IT: L (fragm. ex G-Del), US-1187760 (photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Henry Francois de Fabrega Pittier (1857–1950) Swiss botanist and civil engineer.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, 15–30 cm long, 0.5 mm diam. Culm-internodes glaucous. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, smooth. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 6–7 cm long, 0.5–1 mm wide. Leaf-blade surface scabrous, puberulous, hairy adaxially. Leaf-blade margins ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 6–16 cm long. Primary panicle branches appressed or ascending, 1–2 -nate. Panicle axis smooth or scaberulous. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse or acute.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5 mm long, 0.75 length of upper glume, membranous, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, acute, mucronate. Upper glume lanceolate, 6.5 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, acute, mucronate.

Florets. Fertile lemma linear, subterete, 7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 18–20 mm long limb. Lateral lemma awns present, 18–20 mm long, subequal to principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

Aristida platychaeta S. T. Blake. *Proc. Roy. Soc. Queensl.* 51: 174 (1940).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Queensland: Maranoa District: Mitchell, on open downs on dark greenish brown silty clay 1100 ft., 3 May 1934, S. T. Blake 5701 (HT: BRI; IT: BRI).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (131), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(30)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 216, Fig.16 (1992)).

Derivation (Clifford & Bostock 2007): *G. platys*, broad; *chaete*, bristle. Awns flattened.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–50 cm long, 1–2 -noded. Culm-internodes smooth, distally glabrous. Leaf-sheaths striately veined. Leaf-sheath oral hairs bearded, 3 mm long. Ligule a fringe of hairs, 1 mm long. Collar glabrous. Leaf-blades curled or flexuous, flat, 4–8 cm long, 1–1.5 mm wide. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–23 cm long, 2–3 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 5–7 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 12–18 mm long limb, without a column, persistent. Lateral lemma awns present, 12–18 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 3 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland. South East, Inland. Western Slopes, Western Plains.

Aristida polyclados Domin. *Biblioth. Bot.* 1, 5 : 338 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: K. Domin s.n., Feb 1910, Australia: Nord-Queensland: Cook Dist.: bei Chillagoe (L (photo, BRI); IT: BRI).

Illustrations (Books): J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(7)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), K.Domin, *Bibliotheca Botanica* 85 (1915) (Pl.13).

Derivation (Clifford & Bostock 2007): Gk. *polys*, several; *klados*, branch. Plants with much branched culms often with the branches in fascicles.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending, 29–40 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths scaberulous, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate, 0.5–1 mm long. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades filiform, involute, 8–11 cm long, 0.5–1.8 mm wide. Leaf-blade surface scabrous, rough on both sides, pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 7–19 cm long, 8 cm wide. Primary panicle branches 3-nate, 1–3.5 cm long. Panicle branches pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 17–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.2–1.7 mm long, pubescent, pungent. Floret callus hairs 0.5–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 17–30 mm long, 1.3–1.5 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume surface glabrous or pubescent. Lower glume apex emarginate or obtuse, awned, 1-awned, awn 2–4 mm long. Upper glume lanceolate, 13–20 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume surface glabrous or pubescent. Upper glume apex emarginate or obtuse, awned, 1-awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–8 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3-veined, 0–3-veined. Lemma surface tuberculate, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 32–76 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 15–35 mm long. Lateral lemma awns present, 26–70 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 0.7 mm long. Caryopsis with adherent pericarp, 3.7–5.6 mm long. Hilum linear, 0.5–0.6 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. **Malesia.** Lesser Sunda Is. **Australia.** Northern Territory, Queensland, Western Australia.

Kimberley, Darwin & Gulf. North, Inland.

Aristida portoricensis Pilger. *Urb. Symb. Antill.* 4: 100. (1903).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Puerto Rico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *P. Sintenis* 77, 24 Oct 1884, Puerto Rico: prope Mayaguez in Monte Mesa (B (photo, US); IT: US-820706).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Puerto Rico.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 30–50 cm long. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty. Ligule a fringe of hairs. Leaf-blades curved or flexuous, involute, 5–10 cm long, 0.5–1 mm wide. Leaf-blade surface hirsute, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 3–8 cm long, contracted about primary branches. Primary panicle branches ascending or spreading, 2–4 cm long, bearing spikelets almost to the base. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.75 mm long, pubescent, pungent.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume linear, 7 mm long, 0.7 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex setaceously acuminate. Upper glume linear, 10 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 12 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 20–30 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–3 mm long. Lateral lemma awns present, spreading less than principal, 20–30 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Puerto Rico.

Aristida pradana Leon. *Bull. Torr. Bot. Cl.* 53: 458. (1926).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *Bro. Lesn 12299*, 17 Jul 1924–4 Aug 1924, Cuba: southern Baracoa region, Peladeros de Yauco, upper Yauco River valley, south of Baracoa (NY-71001, US-1258952).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Enrique who collected in Prada, Cuba.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–80 cm long, wiry. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flexuous, involute, 30–60 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 25–35 cm long. Primary panicle branches appressed, distant, 4–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 15–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, obtuse.

Glumes. Glumes lower deciduous, upper persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume linear, 10–12 mm long, 1–1.05 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume linear, 10–12 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 15–17 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 20–30 mm long limb. Lateral lemma awns present, spreading less than principal, 10–15 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida protensa Henrard. *Meded. Herb. Leid.* No. 54 E. 467 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Gharabwin prope Obbia (Harajab Mts.), *Dr. R. E. Drake-Brockman 957* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. protendo*, stretch out. Inflorescence a long spike.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–40 cm long. Ligule a fringe of hairs. Leaf-blades filiform, involute, 15–25 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle spiciform, lanceolate (cuneate), 12–16 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 12–14 mm long, 0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear or lanceolate, 20–25 mm long, 4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, caudate, awned, 1 -awned, awn 5–10 mm long.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 80–90 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 6–8.5 mm long. Lateral lemma awns present, 80–90 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Lodicules 2, oblanceolate, 1.5 mm long, membranous, veined, acute. Anthers 3. Caryopsis with adherent pericarp, linear, 5 mm long.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Aristida pruinosa Domin. *Biblioth. Bot.* 1, 5: 345 (1915).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L.* bluish-green. Leaf-blades are covered with short white hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 60–153 cm long. Culm-internodes glaucous, smooth, distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode, smooth, glabrous on surface. Leaf-sheath oral hairs lacking or ciliate, 1–2 mm long. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous or pubescent. Leaf-blades straight or flexuous, 20–40 cm long, 2–4.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, continuous or interrupted, 15–37 cm long, 2–4 cm wide. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–25 mm long, 1.3–1.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 7.6–15 mm long, 1.1–1.4 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate to acuminate.

Florets. Fertile lemma lanceolate, subterete, 5.4–13.5 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough above. Lemma margins involute, covering most of palea, scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn flat below, with 14–48 mm long limb, without a column, persistent. Lateral lemma awns present, 14–37 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 5–8.3 mm long. Hilum linear, 0.4 length of caryopsis.

Distribution (TDWG). Australasia.

Country /Province /State. Australia. Northern Territory, Queensland, Western Australia.

Kimberley, Ereman. Darwin & Gulf, Victoria R & Barkly Tableland, Central Australia. North, Central, Inland.

Aristida psammophila Henrard. *Meded. Herb. Leid.* No. 58 A. 229 (1932).

TYPE from Australia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *C.T. White s.n.*, Apr 1916, Australia: Queensland: Darling Down Dist.: Dalby (K (photo, BRI); IT: BRI). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 735 (1933).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (131), J.C.Tothill,& J.B.Hacker. *The grasses of southern Queensland* (1983) (104(14)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5): 192, Fig.10 (1992).

Derivation (Clifford & Bostock 2007): Gk. *psamos*, sand; *phileo*, love. Growing in sandy places.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–120 cm long. Culm-internodes smooth or scaberulous, distally glabrous. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs, 0.3 mm long. Collar glabrous or pubescent. Leaf-blades involute, 7–15 cm long, 1.5 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 12–16 cm long, 3–4 cm wide. Primary panicle branches 4–8 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–13 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acuminate, awned, 1 -awned, awn 1–1.5 mm long. Upper glume lanceolate, 7–13 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–10.5 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, reflexed, with 18–25 mm long limb, with twisted column, persistent. Column of lemma awn 1.3–3 mm long. Lateral lemma awns present, 16–23 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 4.8–5.3 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland.

North, South East, Inland. Western Slopes, Western Plains.

Aristida pubescens E. Sanchez. *Darwiniana* 19(3–4): 417 (1975).

Ruthsatz 250/2 pro parte* (HT: BAF; IT: BAA) "estaba mezclada con *Aristida asplundii* Henrard," *fide* Caro & Sanches, *Darwiniana* 9: 421 (1975).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pubesco*, become hairy. Plant whole or in part hairy.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 10–22 cm long, 2 -noded. Culm-internodes elliptical in section, distally pubescent. Lateral branches lacking. Leaf-sheaths pubescent. Leaf-sheath oral hairs bearded, 3.5 mm long. Ligule a fringe of hairs. Collar pubescent. Leaf-blades straight or curved or flexuous, flat or conduplicate, 4–6 cm long, 2–2.5 mm wide. Leaf-blade surface ribbed, grooved adaxially, scaberulous, rough abaxially, puberulous, hairy adaxially. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–10 cm long. Panicle axis pubescent. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 9–10.5 mm long, 0.75 length of upper glume, membranous, 1 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume surface glabrous or puberulous. Lower glume apex awned, 1 -awned, awn 0.8 mm long. Upper glume linear or lanceolate, 11–12 mm long, 1.2 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate or awned, 1 -awned, awn 0.8 mm long.

Florets. Fertile lemma linear, subterete, 9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 14 mm long limb. Lateral lemma awns present, 12 mm long, subequal to principal or shorter than principal. Palea 1.5 mm long, 0.1–0.2 length of lemma, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 1.5 mm long. Anthers 3, 2 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest.

Jujuy, Salta.

Derivation (Clifford & Bostock 2007): *L. purpurasco*, become purple. Inflorescences reddish-purple.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Rhizomes short. Culms slender, 30–80 cm long, 1–2 mm diam. Lateral branches sparse. Leaf-sheaths without keel, glabrous on surface or pubescent. Ligule a fringe of hairs, 0.2–0.3 mm long. Leaf-blades flat or involute, 15–30 cm long, 1–2.5 mm wide. Leaf-blade surface glabrous, hairless except near base.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–35 cm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–10 mm long, 1.1–1.4 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 6–7 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5–7 mm long, coriaceous, purple, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, 15–28 mm long overall, with 15–28 mm long limb, without a column. Lateral lemma awns present, spreading less than principal, 13–18 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Derivation (Clifford & Bostock 2007): *L. purple* to reddish. Usually of purple spikelets.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 25–70 cm long. Leaves mostly basal or basal and cauline. Leaf-sheaths glabrous on surface or puberulous. Leaf-sheath oral hairs

pubescent or ciliate. Ligule a fringe of hairs, 0.3–0.6 mm long. Leaf-blades involute, 3–18 cm long, 0.7–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, nodding, 10–25 cm long. Primary panicle branches appressed or spreading. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, pungent.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8 mm long, 0.5 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 11–15 mm long, 1.1–1.3 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 10–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above or in lines. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 35–45 mm long limb, without a column. Lateral lemma awns present, 35–45 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *pyknos*, thick; *stachys*, ear of corn. Inflorescence a contracted panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms 50–90 cm long. Ligule a fringe of hairs. Leaf-blades convolute, 20–50 cm long, 1.5–3 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle, exserted. Panicle spiciform, oblong (oblanceolate), 15–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 29–38 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.7 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 23.5–27 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume lanceolate, 29–38 mm long, 4–5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate, awned.

Florets. Fertile lemma lanceolate, subterete, 7.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 70–85 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 16 mm long. Lateral lemma awns present, 70–85 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Aristida queenslandica Henrard. *Meded. Herb. Leid.* No. 54 a. 488 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: P.A. O'Shanesy 13, 1879, Australia: Queensland: Leichhardt Dist.: on ridges near Cometville (L-925.125–52 (photo, BRD); IT: MEL).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Queensland, Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 25–100 cm long, 1–2 mm diam., 2–4 -noded. Culm-internodes smooth or scaberulous, distally glabrous or hirsute. Lateral branches lacking or sparse or ample or fastigiate. Leaf-sheaths smooth or scaberulous, glabrous on surface or pilose. Leaf-sheath oral hairs ciliate, 1–3 mm long. Ligule a fringe of hairs, 0.2–0.5 mm long. Collar glabrous or pubescent. Leaf-blades curled, 20–40 cm long, 2 mm wide. Leaf-blade surface scaberulous, rough abaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 9–64 cm long, 2–4.5 cm wide. Primary panicle branches 5–11 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6.2–10.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–0.9 mm long, pubescent, acute.

Glumes. Glumes deciduous, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.2–11 mm long, 0.8–1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate, mucronate. Upper glume lanceolate, 6.2–10.5 mm long, 0.8–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex acute or acuminate, mucronate, 1 -awned.

Florets. Fertile lemma lanceolate, subterete, 5–12 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins involute, covering most of palea, without distinctive roughness. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 8–16 mm long limb, without a column, persistent. Lateral lemma awns present, 3–10 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 0.9–1.9 mm long. Caryopsis with adherent pericarp, sulcate on hilar side, 4.1–6.1 mm long. Hilum linear, 0.3–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland.

Darwin & Gulf. North, Central, South East, Inland. Coast.

Derivation (Clifford & Bostock 2007): *L. ramus*, branch; -osa, abundance. Inflorescences or culms much branched.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 37–103 cm long, 2 -noded. Culm-internodes smooth, distally glabrous. Lateral branches ample. Leaf-sheath oral hairs lacking or ciliate, 1.2–2.2 mm long. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous or pubescent. Leaf-blades involute, 6–12 cm long, 0.6–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 8–27 cm long, 1.5–6 cm wide. Primary panicle branches 2–5 cm long, bearing spikelets almost to the base. Panicle branches with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5–1.2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.7–9 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1(–3) -veined. Lower glume primary vein smooth to scabrous. Lower glume lateral veins absent or obscure. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 5.2–10.7 mm long, 0.7–0.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface smooth to scabrous. Upper glume apex obtuse to acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–14 mm long, coriaceous, pallid or light brown, concolorous or mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous or papillose. Lemma margins involute or convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn straight or curved, spreading, flat below, with 8–20 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 7–17 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.3–1.9 mm long. Caryopsis with adherent pericarp, without sulcus or sulcate on hilar side, 5–8.7 mm long. Hilum linear, 0.5 length of caryopsis.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *E. Engelmann s.n.*, no date, USA: Illinois: St. Clair Co.: dry slopes (GH; ILT: US-745328). LT designated by Hitchcock, *Contr. U.S. Natl. Herb.* 22(7): 538 (1924).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (327).

Derivation (Clifford & Bostock 2007): *L. ramus*, branch; *-osa*, abundance; *-issima*, most.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 25–50 cm long. Lateral branches ample. Leaf-sheaths without keel, glabrous on surface. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades flat or involute, 0.5–1 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–12 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 18–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 13–20 mm long, 0.9 length of upper glume, membranous, 3–7 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 18–22 mm long, 1.1 length of adjacent fertile lemma, membranous, 1–3 -veined. Upper glume lateral veins absent or distinct. Upper glume apex dentate, 2 -fid, acute, awned, 1 -awned, awn 2–6 mm long.

Florets. Fertile lemma linear, subterete, 16–25 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, recurved at base of limb, with 18–28 mm long limb, with a straight or slightly twisted column. Column of lemma awn 5 mm long. Lateral lemma awns present, 0.5–4 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, Northeast USA, South-central USA, Southeastern USA. Iowa, Missouri, Oklahoma. Ohio. Texas. Arkansas.

Aristida recta Franch. *Bull. Soc. Hist. Nat. Autun.* 8: 365. (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Congo. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. de Brazza & Thollon* 226, Oct 1883, Congo Francais: Hab.-Congo, aux environs de Franceville (P; IT: K).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (312, Fig 277).

Derivation (Clifford & Bostock 2007): L. upright. Panicle branches erect or spike-like.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Roots simple (wiry). Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms 10–30 cm long. Culm-internodes distally glabrous. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades filiform, involute, 5–20 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or ovate, 3–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.3 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 2.5–6 mm long, 0.5–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acuminate, mucronate. Upper glume cuneate, 5–7.5 mm long, 1.2–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma elliptic, subterete, 4–5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate, with a short cylindrical neck, with this appendage 0.5 mm long, awned, 3 -awned. Principal lemma awn 3-branched, with 6–8 mm long limb, without a column, persistent. Lateral lemma awns present, gyrate, 6–8 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, West-Central Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Ghana, Guinea, Nigeria. Central African Republic, Cameroon, Gabon, DRC. Tanzania, Uganda. Angola, Malawi, Mozambique, Zambia, Zimbabwe. Limpopo, Gauteng, Mpumalanga, Swaziland.

Aristida recurvata H. B. & K. *Nov. Gen. et Sp.* 1: 123. (1815).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Humboldt & M.A. Bonpland s.n.*, May, Venezuela: Bolmvar: prope Santo Thomas de la Angostura (P-Bonpl.; IT: B-W, P, US-81272 (fragm. ex P & photo)).

Recent Synonyms: *Aristida neesiana* Trin. & Rupr., *Mem. Acad. Petersb. Ser.* 6 (7) 113. (1849).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (33, Fig. 15).

Derivation (Clifford & Bostock 2007): L. reflexed. Spikelets with spreading or reflexed awns.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 53–150 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking or bearded (deciduous hairs). Ligule a ciliolate membrane, 0.2–0.3 mm long. Collar glabrous. Leaf-blades curled (lower) or straight (upper), flat (lower) or conduplicate (upper), 12–50 cm long, 1–4 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 16–40 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.2–0.4 mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower in general slightly longer than upper, sometimes subequal or lower slightly shorter than upper). Lower glume lanceolate, 7.5–12.6 mm long or 5 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 7.3–11.5 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma subterete, 3–5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, with a median groove (ventral, longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn coiled (at base), ascending, simple at base, with 9.5–21 mm long limb, with twisted column. Column of lemma awn 0.8–2 mm long. Lateral lemma awns present, wrapped around principal, 6–17 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Pl. 11).

Derivation (Clifford & Bostock 2007): *L. reduco*, reduce. Lateral branches of awn very reduced.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 20–90 cm long. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths 1.5–7 cm long, keeled. Ligule a fringe of hairs. Leaf-blades convolute, 7–30 cm long, 1–2 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 10–40 cm long, 5–10 cm wide. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, bearded, pungent.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–17 mm long, 1 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex awned, 1 -awned. Upper glume lanceolate, 10–17 mm long, 1 length of adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume awned, 1 -awned.

Florets. Fertile lemma elliptic, subterete, 10–17 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 1 -awned or 3 -awned. Principal lemma awn straight or 3-branched, with 15–20 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 8–10 mm long. Lateral lemma awns absent or present, 0–3 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Karnataka. Madhya Pradesh, Maharashtra, Rajasthan, Tamilnadu, West Bengal.

Aristida refracta Griseb. *Cat. Pl. Cub.* 228. (1866).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C. Wright 3431*, 1860–1864, Cuba (GOET; IT: LE, US-81271, US-991856 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. curved back abruptly. Mostly applied to species whose mature inflorescence branches curve back.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms prostrate, 20–60 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades filiform, involute, 5–15 cm long, 0.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches ascending, 1–3 cm long. Panicle branches stiff. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 4–5 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, acute, mucronate. Upper glume linear, 5–7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, acute, mucronate.

Florets. Fertile lemma linear, subterete, 4.5 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 10 mm long limb. Lateral lemma awns present, gyrate, 10 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Dominican Republic, Haiti, Jamaica, Puerto Rico.

Aristida repens Trin. *Mem. Acad. Imp. Sci. St.-Petersbourg, Ser. 6, Sci. Math.* 1(1): 87. 1830.

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.D. Prescott s.n.*, 1928–1929, Galapagos Islands (LE; IT: K, US-81270 (fragm. ex LE)). HT: *Douglas s.n.*, Ecuador: Galapagos (LE; IT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. repo*, crawl. Rhizome well developed.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 15–50 cm long, rooting from lower nodes. Culm-internodes terete, smooth or scaberulous. Lateral branches ample. Leaf-sheaths mostly shorter than

adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Collar glabrous. Leaf-blades flat or convolute, 10–15 cm long, 1–1.5 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–15 cm long. Primary panicle branches appressed, 1-nate, 1–3 cm long, bearing spikelets almost to the base. Panicle axis angular, scaberulous. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–1.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex attenuate. Upper glume lanceolate, 5–7 mm long, membranous, 1-keeled, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex dentate, 2-fid, mucronate.

Florets. Fertile lemma oblong, subterete, 3–5 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 5–10 mm long limb, with twisted column, deciduous, abscising from top of column. Column of lemma awn 0.5–2.5 mm long. Lateral lemma awns present, 5–7 mm long, subequal to principal.

Distribution (TDWG). Continent. Pacific and South America.

Country /Province /State. South-central Pacific (Henrard 1999). Marquesas. Western South America. Galapagos.

Aristida rhiniochloa Hochst. *Flora*, 8: 200. (1855).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ethiopia, Gageros: *Schimper in Buchinger 1229* (P iso, K).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): Gk. *rhine*, file; *chloa*, grass. Leaf-blades scabrid.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 20–60 cm long. Culm-internodes antrorsely scabrous, distally glabrous. Culm-nodes pubescent. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Leaf-blades 10–20 cm long, 2–4 mm wide. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, interrupted, 8–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–17 mm long, 1.1–1.2 length of upper glume, chartaceous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5–15 mm long, 0.7–1.2 length of adjacent fertile lemma, chartaceous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex dentate, 2-fid, mucronate.

Florets. Fertile lemma elliptic, subterete, 7–13 mm long, coriaceous, keeled, 3-veined, 0–3-veined. Lemma surface scabrous, rough in lines. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 15–30 mm long limb, persistent. Lateral lemma awns present, 15–30 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Mali, Mauritania, Niger. Eritrea, Ethiopia (inc. Eritrea), Sudan. Tanzania. Angola, Zambia, Zimbabwe. Botswana, Limpopo, North-West, Mpumalanga.

Aristida rhizomophora Swallen. *J. Wash. Acad. Sci.* 19(10): 196, f. 1. 1929.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Paul Weatherwax 1081*, 30 Jun 1928, USA: Florida: prairie region north of Lake Okeechobee, near Fort Bassenger (US-1435634; IT: L, US-1389883).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (336).

Derivation (Clifford & Bostock 2007): Gk. *rhizoma*, a root; *phero*, bear. Plant with well developed scaly rhizomes.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated, scaly. Culms erect, 65–80 cm long. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flexuous, flat or conduplicate, 7–10 cm long, 1–2 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 20–30 cm long. Primary panicle branches ascending, distant, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 8–14 mm long, 0.66–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate or setaceously acuminate. Upper glume linear, 12–17 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate or setaceously acuminate.

Florets. Fertile lemma linear, subterete, 9–12 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn reflexed or recurved at base of limb, with 18–24 mm long limb. Lateral lemma awns present, spreading as much as principal, 15–20 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Florida.

Aristida riograndensis B.M.A. Severo & I.I. Boldrini. *Bradea* 3(30): 239 (1982).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brasil: Rio Grande do Sul: Arroio dos Ratos, BR 290, Km. 58, *Valls, Severo et al. 4241* (HT: ICN-43616).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Rio Grande de Sul, Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 53–115 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.1–0.2 mm long. Collar pubescent (discontinuous on the mid vein). Leaf-blades straight or curved (slightly), conduplicate, (4–)11–84 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (subcontracted, not linear), 16–34 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.7–1.2 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 15–23 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 23–35 mm long, 1 -veined. Upper glume primary vein scaberulous. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate, awned.

Florets. Fertile lemma subterete, 13–22(–25) mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 50–100 mm long limb, without a column. Lateral lemma awns present, ascending, 50–100 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.

Rio Grande do Sul.

Aristida riparia Trin. *Bull. Acad. Petersb.* 1: 68. (1836).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Riedel s.n.*, Dec 1824, Brazil: Parana: in arenosis ripae rivuli Jacari (LE-TRIN-1340.01; IT: US-81265 (fragm. ex LE)).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (275, Fig 55), S.A.Renvoize, *The Grasses of Bahia*, 1984 (53, Fig. 18), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (32, Fig. 12), E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (67, Fig 8).

Derivation (Clifford & Bostock 2007): *L. ripa*, river bank; *-aria*, pertaining to. Growing on river banks.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms (60–)90–130(–180) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.4–0.8 mm long. Collar glabrous. Leaf-blades straight or curled (lower, very rarely), flat or convolute (upper, rarely), 19–70 cm long, (2.8–)3–5 mm wide. Leaf-blade surface scabrous, rough on both sides, pilose (at base), densely hairy (lanose at base, adaxially), hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 20–44 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1–1.5 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 12–22 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acute or acuminate, awned. Upper glume lanceolate, 10–22 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute or acuminate.

Florets. Fertile lemma subterete, 6–8 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface smooth, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with (26–)32–64 mm long limb, with twisted column. Column of lemma awn (6–)14–24(–52) mm long (sometimes variation in the same inflorescence). Lateral lemma awns present, ascending, 22–42(–60) mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia, Colombia. Brazil Northeast, Brazil Southeast, Brazil North, Brazil South. Argentina Northwest, Argentina Northeast.

Aristida rosei Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 584 (1924).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Dominican Republic. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.N. Rose, W.R. Fitch & P.G. Russell 4027*, 1 Mar 1913, Dominican Republic: Hispaniola I.: Azua, hillside west of town (US-760164; IT: L (fragm. ex US), NY-71003 [as 18 Mar 1913]).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Joseph Nelson Rose (1862–1928) who collected widely in the Americas.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, slender, 30–50 cm long, wiry. Leaf-sheaths keeled, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.4 mm long. Leaf-blades ascending or spreading, involute, 2–5(–10) cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches appressed or ascending. Panicle branches flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 5 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein smooth. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 6–7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma linear, subterete, 6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 10 mm long limb. Lateral lemma awns present, gyrate, 10 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Dominican Republic, Haiti.

Aristida rufescens Steud. *Syn. Pl. Gram.* 421. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Boivin s.n.*, Madagascar: insulae Nossibi et Maynote (P; IT: W).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (99, Fig 27).

Derivation (Clifford & Bostock 2007): *L. refesco*, grow reddish. Spikelets or inflorescence reddish-brown.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 70–100 cm long. Culm-nodes swollen. Lateral branches lacking or sparse. Leaf-sheaths hirsute. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades convolute, 30–40 cm long, 3 mm wide, coriaceous, stiff. Leaf-blade surface scabrous, rough adaxially, pubescent, hairy adaxially. Leaf-blade margins scabrous. Leaf-blade apex filiform.

Inflorescence. Inflorescence a panicle. Panicle open, linear to elliptic, dense, 12–25 cm long. Primary panicle branches 2–6 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7.5 mm long, 0.9 length of upper glume, membranous, 1-keeled, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or obscure. Lower glume surface pubescent. Lower glume apex attenuate, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 8.5 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled. Upper glume primary vein scabrous. Upper glume apex attenuate, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma lanceolate, subterete, 4.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 13–14 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2 mm long. Lateral lemma awns present, 13–14 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Aristida sanctae-luciaae Trin. *Diss.* 2: 25. (1826).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: LT: *Riedel s.n.*, Brazil: in declivibus prope Santa Luzia (LE-TRIN-1342.01; ILT: US-991969 (fragm. ex LE)). "sent by Langsdorff, probably collected by Riedel"; cited by Longhi-Wagner, *Bol. Inst. Bot. (Sco Paulo)* 12: 145 (1999).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): from St. Luzia, Brazil.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 10–25 cm long. Leaf-sheath oral hairs scanty. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades erect, straight, conduplicate, 2.9–8 cm long, 0.8–1.2 mm wide. Leaf-blade surface scabrous, rough abaxially. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 4–9 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, 3.4–3.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2–0.3 mm long, pilose, obtuse.

Glumes. Glumes similar. Lower glume lanceolate, 2.8–3.5 mm long, 0.8–0.9 length of upper glume, purple, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, setaceously acuminate. Upper glume lanceolate, 3.4–3.8 mm long, 1.2 length of adjacent fertile lemma, purple, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, attenuate.

Florets. Fertile lemma lanceolate, subterete, 2.8–3.2 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 7.5–10 mm long limb, with twisted column. Column of lemma awn 0.8–1 mm long. Lateral lemma awns present, ascending, 7.5–10 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Southeast.

Distrito Federal, Goiás. Minas Gerais, Rio de Janeiro, Sao Paulo.

Aristida sandinensis Catasz. *Novosti Sist. Vyssh. Rast.* 21: 21. 1984.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Sandino, Cuba.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Aristida sayapensis Caro. *Kurtziana* 1: 159 (1961).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Argentina: San Luis: Sayape, 28 Dec 1925, *Castellanos s.n.* (HT: BA-25/2732).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Laguna Sayape, Argentina.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal, subterete. Culms erect, 30–50 cm long, 2–3 -noded. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs bearded, 3–4 mm long. Ligule a fringe of hairs. Collar glabrous. Leaf-blades flat or convolute, 7–15.5 cm long, 2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, bearing few spikelets. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 15–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 13–17 mm long, 0.9–1 length of upper glume, membranous, 3 -veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent or obscure. Lower glume apex awned, 1 -awned, awn 1–1.5 mm long. Upper glume linear, 15–17 mm long, 1.5 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate or awned, 1 -awned, awn 0.5–1 mm long.

Florets. Fertile lemma linear, subterete, 10–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 40–45 mm long limb. Lateral lemma awns present, 35–40 mm long, subequal to principal or shorter than principal. Palea 1.75–2 mm long, 0.1–0.2 length of lemma, hyaline, 0 -veined.

Flower and Fruit. Lodicules 2, 1.75 mm long. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest. San Luis.

Aristida scabrescens L. Liou. *Fl. Xizangica* 5: 84 (1987).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Qamdo: Qinghai-Xizang Complex Exped. 97 (HP holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 635).

Derivation (Clifford & Bostock 2007): *L. scabresco*, becoming rough. Leaf-blades rough.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40 cm long, 0.5–1 mm diam., 1–2-noded. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades involute, 10 cm long, 1–2 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 6–10 cm long. Primary panicle branches bearing 1–2 fertile spikelets on each lower branch. Panicle axis scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 8–10 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 7–8 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scabrous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 8–10 mm long limb, with twisted column, persistent, limb scabrous. Column of lemma awn 2–3 mm long. Lateral lemma awns present, 5–7 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. Tibet.

Aristida scabrivalvis Hackel. *Bull. Herb. Boiss. Ser. 2*, 6: 708 (1906).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: ST: A. *Schlechter 4689*, 1894, South Africa: Transvaal: in arenosis prope Makapans-Poort, 1600 m (Z; IST: BM, BO, G, GRA, K, TRV, US-81264, W (photo, US)). ST: *Schlechter 4217*, 1894, South Africa: Transvaal: in graminosis prope Pienaarsrivier-Brug, 1430 m (BM, G, GRA, K, P, PRE, TRV, W, Z).

Illustrations: None found.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. scaber*, rough; valva, leaf of a folding door. The lemmas and/or glumes are densely hispid.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, 15–50 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades 3–30 cm long, 2–3.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–30 cm long, evenly furnished or with spikelets clustered towards branch tips. Primary panicle branches branching divaricately. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 5–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.5–6 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1-veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface glabrous or puberulous. Lower glume apex acute, awned, 1-awned, awn 1–2.5 mm long. Upper glume lanceolate, 5–8 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1-veined. Upper glume primary

vein scaberulous. Upper glume lateral veins absent. Upper glume surface glabrous or puberulous. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–2.5 mm long.

Florets. Fertile lemma elliptic, subterete, 5–7 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface smooth or scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–20 mm long limb, persistent. Lateral lemma awns present, 10–20 mm long, subequal to principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa, Southern Africa. Tanzania. Angola, Malawi, Zambia, Zimbabwe. Namibia, Botswana, Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Kwazulu-Natal, Northern Cape.

Aristida schebheliansis Henrard. *Meded. Herb. Leid.* No. 54 a. 537 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Paoli 1327*, 26 Nov 1913, Somalia: R. Shebelli between Giabadgeh and Muccoiddere (FI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Wabi-Shabali, Ethiopia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–50 cm long, wiry. Ligule a fringe of hairs. Leaf-blades involute, 15–30 cm long, 1.5–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 18–20 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, thinner than fertile lemma. Lower glume lanceolate, (10.5–)12–13 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn (5–)8–9 mm long. Upper glume lanceolate, 18–20 mm long, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, awned, 1 -awned, awn (6.5–)13–14 mm long.

Florets. Fertile lemma lanceolate, subterete, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 50–65 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 10 mm long. Lateral lemma awns present, 50–65 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Somalia.

Aristida schiedeana Trin. & Rupr. *Mem. Acad. Petersb. Ser.* 6, 7: 120. (1849).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *C.J.W. Schiede & F. Deppe 909*, 1837, Mexico: Veracruz: prope Jalapa (LE-TRIN-1343.01 (& illust.); IT: LE-TRIN-1343.02 (fragm.), US-2947076 (fragm. ex LE)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (325 as var. *orcuttiana*), F.W.Gould, *The Grasses of Texas* (1975) (399, Fig. 212 as *A. orcuttiana*), G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 45, Fig. 8 (1997)).

Illustrations (Journals): *Ruizia* (13:233, Fig 26g-h (1993)).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Christian Julius Wilhelm Schiede (1798–1836) German-born Mexican botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 75–150 cm long. Ligule a fringe of hairs. Leaf-blades flat or involute, 20–40 cm long, 1–3 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or elliptic, 10–30 cm long. Primary panicle branches 5–15 cm long. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.7 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–11 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface puberulous, hairy generally or in lines. Lower glume apex acuminate. Upper glume lanceolate, 6–11 mm long, 1–1.1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 5–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned or 3 -awned. Principal lemma awn geniculate or 3-branched, with 5–15 mm long limb, with twisted column. Column of lemma awn 5–6 mm long. Lateral lemma awns absent or present, 0–2.5 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

$2n = 22$ (1 ref TROPICOS), or 44.

Distribution (TDWG). Continent. North America, South America.

Illustrations (Journals): *Austr. Syst. Bot.* (5: 188, Fig.9 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Frederick Schultze (fl. 1869) who collected in northern Australia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 35–65 cm long. Culm-internodes smooth, distally glabrous. Lateral branches fastigiate. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 3–4 mm long. Ligule a fringe of hairs, 0.4–0.6 mm long. Collar glabrous. Leaf-blades flexuous, involute, 10–25 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, elliptic, 22 cm long, 6 cm wide. Primary panicle branches 2–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–21 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–18 mm long, 0.6–0.9 length of upper glume, membranous, 1-keeled, 3–7 -veined. Lower glume surface asperulous or scabrous, rough above. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1–2.3 mm long. Upper glume lanceolate, 11–21 mm long, 1.1–1.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1–2.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 10–12 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, subterete below, with 20–30 mm long limb, with twisted column, persistent. Column of lemma awn 5–7 mm long. Lateral lemma awns present, 18–26 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 7–8 mm long. Hilum linear, 0.2 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland. Darwin & Gulf. North, Central.

Derivation (Clifford & Bostock 2007): Gk. *skiouros*, squirrel; *-oides*, resembling. Inflorescence resembles a squirrel's tail.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 70–200 cm long, 3–6 -noded. Culm-internodes glaucous, smooth, distally glabrous. Lateral branches sparse. Leaf-sheaths smooth, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.2–0.5 mm long. Collar glabrous or pubescent. Leaf-blades curled or flexuous, 10–21 cm long, 2 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous or pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, 16–60 cm long, 1–4 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10.5–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10.5–17 mm long, 1 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface smooth to scabrous. Lower glume apex obtuse, awned, 1 -awned, awn 1.5–4 mm long. Upper glume lanceolate, 10.5–17 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate.

Florets. Fertile lemma lanceolate, subterete, 8.5–13 mm long, coriaceous, pallid or light brown or purple, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or papillose, rough above. Lemma

margins involute, covering most of palea, scabrous. Lemma apex acute, awned, 3 -awned. Principal lemma awn curved, flat below, 2 mm long overall, with 15–36 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 11–30 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side, 7.5–9 mm long. Hilum linear, 0.4–0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.
North, Central, Inland.

Aristida sciurus Stapf. Dyer, *Fl. Cap.* 7: 557. (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *W. Nelson 26*, 1880, South Africa: Transvaal: Zebedelis Kraal, near the Inkumpi River (K; ILT: PRE). Illustrations: None found.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. sciurus*, squirrel. Culms covered with snow-white woolly indument.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, robust, 70–140 cm long, 5–6 mm diam., 4–5 -noded. Culm-internodes distally woolly. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface or woolly. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades conduplicate, 30–60 cm long, 2–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 20–45 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1 mm long, bearded, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface asperulous, rough above. Lower glume apex acute. Upper glume oblong, 11–13 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume mucronate.

Florets. Fertile lemma elliptic, subterete, 10–12 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex rostrate, awned, 3 -awned. Principal lemma awn with 15–23 mm long limb, persistent. Lateral lemma awns present, 15–23 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Limpopo, Mpumalanga, Swaziland, Free State, Kwazulu-Natal.

Aristida scribneriana Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 566 (1924).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *-acea*, indicating resemblance. With bristle-like leaf-blades.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths coriaceous, yellow, glossy. Culms erect, 50–120 cm long. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades filiform, flat or convolute, 20–40 cm long, 2–2.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 15–40 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume oblong, 9–13 mm long, 0.75–0.9 length of upper glume, scarious, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex attenuate, awned, 1 -awned, awn 2–5 mm long. Upper glume oblong, 12–15 mm long, 1 length of adjacent fertile lemma, scarious, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2–5 mm long.

Florets. Fertile lemma linear, subterete, 11–13 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal

lemma awn 25–40 mm long overall, persistent. Lateral lemma awns present, 25–40 mm long, subequal to principal. Palea 1.3 mm long, 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

$2n = 22$.

Distribution (TDWG). Continent. Africa, Tropical Asia.

Country /Province /State. Western Indian Ocean. Mauritius (*), Madagascar, Rodrigues, Seychelles.

Indian Subcontinent, Indo-China, Malesia. Bangladesh, India, Sri Lanka. Myanmar, Thailand. Malaya.

Andhra Pradesh, Bihar, Gujarat, Karnataka, Kerala. Madhya Pradesh, Maharashtra, Orissa, Rajasthan, Tamilnadu, Uttah Pradesh, West Bengal. Himachal Pradesh.

Aristida setifolia H. B. & K. *Nov. Gen. et Sp.* 1: 122. (1815).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Aristida doelliana* Henrard, *Meded. Herb. Leid. No.* 54, 154, 163 (1926). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A. Humboldt & A. M. Bonpland s.n.*, Sep, Venezuela: Monagas: inter Bordones et Cumana (P-Bonpl.; IT: B-W, US-1448324 (fragm. ex P & photo)).

Recent Synonyms: *Aristida doelliana* Henrard, *Meded. Herb. Leid. No.* 54, 154, 163 (1926).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (51, Fig. 17 & 53, Fig. 18 as *A. doelliana*), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (33, Fig. 16).

Illustrations (Journals): *Ruizia* (13:233, Fig 26c-d (1993)).

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *folium*, leaf. Leaf-blades bristle-like.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 40–100(–150) cm long. Lateral branches sparse, arising from mid culm or upper culm. Leaf-sheath oral hairs lacking (or pilose, deciduous hairs). Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades straight, conduplicate or flat (less frequent), (4–)7–25(–46) cm long, 1–6 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous (generally) or pilose, hairless except near base, hairy adaxially. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), 9–16(–32) cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.8–1 mm long, bearded, acute.

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, 4.2–7 mm long, 1–3 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough generally. Lower glume apex acute, muticous. Upper glume lanceolate, 5.2–8.5 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex dentate, 2 -fid, acute.

Florets. Fertile lemma subterete, 4–5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma midvein scabrous (on keel). Lemma surface scaberulous, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending (generally) or reflexed (less frequent), with 10–24 mm long limb, with twisted column, deciduous, abscissing from top of column. Column of lemma awn 2–5 mm long. Lateral lemma awns present, ascending, 4–5 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America, Brazil. Belize, Honduras. Guyana, Surinam, Venezuela. Colombia, Peru. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil North.

Roraima, Mato Grosso, Goias, Bahia, Maranhao, Piaui, Ceara, Rio Grande do Norte, Paraiba, Pernambuco, Alagoas, Sergipe, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana. Distrito Federal, Mato Grosso, Goiás, Mato Grosso do Sul. Bahia, Ceará, Maranhão, Pernambuco, Paraíba, Piauí, Rio Grande do Norte (RN). Roraima. Minas Gerais, Rio de Janeiro, Sao Paulo.

Aristida sieberiana Trin. Spreng. *Neue Entdeck.* 2: 61. (1821).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Israel. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Sieber s.n.*, Israel: pr. Joppe (LE; IT: K). herb. Meyer.

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 359).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Franz Wilhelm Sieber (1789–1844) Bohemian botanist and traveller.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–100 cm long, 2–4 mm diam., woody. Culm-internodes distally glabrous. Lateral branches suffrutescent. Ligule a fringe of hairs. Leaf-blades involute, 5–30 cm long, 1–2 mm wide, glaucous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 8–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, pubescent, with longer hairs above, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–15 mm long, 0.5–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn (1–)2–5 mm long. Upper glume linear, 15–20 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex lobed, 2 -fid, awned, 1 -awned, awn (1–)3–9 mm long.

Florets. Fertile lemma oblong (cylindrical), subterete, (7–)9–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous or scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 45–85 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn (12–)18–30 mm long. Lateral lemma awns present, 30–70 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northern Africa, West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa, East Tropical Africa. Algeria, Tunisia. Benin, Burkina, Ghana, Guinea, Ivory Coast, Mali, Mauritania, Nigeria, Senegal, Togo, Niger. Cameroon. Somalia, Sudan. Kenya. **Western Asia, Arabian Peninsula.** Lebanon-Syria. Yemen.

Aristida similis Steud. *Syn. Pl. Gram.* 420. (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Boivin 1630*, Madagascar: St. Maria (P; IT: FI, W).

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (103, Fig 29).

Derivation (Clifford & Bostock 2007): *L.* like. Readily confused with one or more other species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 40–60 cm long. Lateral branches sparse. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades convolute, 5–15 cm long, 1 mm wide. Leaf-blade surface smooth, glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–10 cm long, 0.5–1 cm wide. Primary panicle branches 1–2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume lanceolate, 7–8 mm long, 2.5 length of adjacent fertile lemma, membranous, 1-keeled. Upper glume primary vein smooth. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 12–13 mm long limb, with twisted column. Column of lemma awn 2–3 mm long. Lateral lemma awns present, 9–10 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Aristida simpliciflora Chapm. *Cault. Bot. Gaz.* 3: 18. (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ILT: *A. W. Chapman s.n.*, 18--, USA: Florida (US-81257; ILT: W-15065). LT designated (as duplicate type) by Hitchcock, *Contr. U.S. Natl. Herb.* 22(7): 580 (1924); US sheet designated (as type) by Henrard, *Meded. Rijks-Herb.* 54(B): 568 (1928).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (339).

Derivation (Clifford & Bostock 2007): *L. simplex*, simple; flos, flower. Inflorescence a raceme.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, slender, 30–60 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades flat, 5–15 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, linear, curved, 10–20 cm long, bearing few spikelets. Primary panicle branches indistinct the panicle almost racemose. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.75 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 6–7 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface scabrous. Lower glume apex setaceously acuminate. Upper glume linear, 6–7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex scabrous, awned, 3 -awned. Principal lemma awn recurved at base of limb, with 15 mm long limb. Lateral lemma awns present, spreading less than principal, 12 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, Mississippi, North Carolina.

Aristida somalensis Stapf. *Kew Bull.* 1907. 216. (1907).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia, Golis Range: *Drake-Brockman 127* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Somalia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 10–30 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 8–25 cm long, 1–2.5 mm wide, stiff. Leaf-blade surface scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, loose or effuse, 10–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–12 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate, mucicous or mucronate. Upper glume linear, 13–18 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 25–40 mm long limb, with twisted column, persistent. Column of lemma awn 7–10 mm long. Lateral lemma awns present, 25–40 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea), Somalia. Kenya.

Aristida spanospicula K.W. Allred J. Valdes-Reyna & J. Sanchez-Ken. *Novon* 5(3): 214 (1995).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Chihuahua: Sierra Madre Occidental, at Cuesta Prieta, along road from San Juanito to Creel, 3.1 mi S of San Juanito, pine forest with scrub oak understory of *Lupinus*, *Muhlenbergia*, and *Trisetum*, thin forest loam calcareous soil, numerous clumps among the scrub oak, 7500 ft (2280 m), 22 Sep 1992, *K.W. Allred & J. Valdis-Reyna 5787* (HT: NMCR; IT: ANSM, NMC, TAES).

Illustrations (Journals): *Novon* (5:215, Fig.4 (1995)).

Derivation (Clifford & Bostock 2007): Gk *spanos*, scarce; L. *spika*, spike; *-ula*, diminutive. Spikelets fewer than in related species.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, 20–60 cm long. Culm-internodes terete, smooth or scaberulous, distally glabrous. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, without keel, glabrous on surface or pilose. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades flat or conduplicate, 14–25 cm long, 1.5–2 mm wide. Leaf-blade surface glabrous or puberulous, hairy adaxially. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle, comprising 3–12 fertile spikelets. Panicle open, oblong, equilateral or nodding, 8–22 cm long, 1–2 cm wide, bearing few spikelets. Primary panicle branches ascending, bearing 1–2(–4) fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 16–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–1 mm long, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–15 mm long, 1 length of upper glume, membranous, light brown, 1 -veined. Lower glume lateral veins absent. Upper glume lanceolate, 9–15 mm long, 1–1.5 length of adjacent fertile lemma, membranous, light brown, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, with 10–20 mm long limb, with twisted column. Column of lemma awn 6–15 mm long. Lateral lemma awns absent. Palea 1 mm long, hyaline, 2-keeled.

Flower and Fruit. Lodicules 2, 1–1.5 mm long. Anthers 3, 2 mm long, brown. Caryopsis with adherent pericarp, fusiform, 7–9 mm long.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northeast Mexico, Northwest Mexico. Chihuahua, Durango, Sonora.

Aristida spectabilis Hack. *Bull. Herb. Boiss.* 3: 380. (1895).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Rehmann 4695, 1875–1880, South Africa: Transvaal: Pretoria, Kuduspoort (W (photo, US-81254); IT: B, US-81254 (fragm. ex W), Z).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. showy. Attractive or outstanding in some respect such as height.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 100–180 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs lacking or woolly. Ligule a fringe of hairs. Leaf-blades flat or involute, 30–60 cm long, 4–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, nodding, 30–40 cm long, 10–25 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, bearded, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or lanceolate, 6–12 mm long, 0.5–1 length of upper glume, membranous, much thinner above, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume linear or lanceolate, 10–12 mm long, 1.5 length of adjacent fertile lemma, membranous, much thinner above, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 6.5–7.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–44 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 5–6 mm long. Lateral lemma awns present, 20–28 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Limpopo, North-West, Gauteng.

Aristida spegazzinii Arechav. *Anal. Mus. nac. Buenos Aires*, 4: 177 fig. I. (1895).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *J. Arechavaleta* 34, Nov 1891, Uruguay: campos gramíneos del Uruguay, terrenos pedregosos sierrita de Independencia (W; ILT: BAA). LT designated by Henrard, *Meded. Derivation (Clifford & Bostock 2007): in honor of Carlo Luigi Spegazzini (1858–1926) Italian-born Argentinian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 22–70 cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.8–1.2 mm long. Collar glabrous. Leaf-blades curled or flexuous, convolute, 5–27 cm long, 0.5–1.2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, smooth.

Inflorescence. Inflorescence a panicle. Panicle contracted (subcontracted), 10–15 cm long. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.5–1 mm long, pilose, acute (or subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 11–17(–20) mm long, 1–3 -veined (lateral veins free). Lower glume surface scabrous, rough generally. Lower glume apex acute (shortly awned), muticous. Upper glume lanceolate, 8–12 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute or acuminate or setaceous acuminate.

Florets. Fertile lemma subterete, 10–14(–16) mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, with a median groove (ventral, longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 30–118 mm long limb, without a column. Lateral lemma awns present, ascending, 30–118 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast, Brazil South. Argentina Northeast, Argentina South, Chile Central, Uruguay.

Aristida spiciformis Ell. *Sketch* 1: 141. (1816).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: USA: vicinity of Charleston? (CHARL).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico Vol 25 Poaceae*, part 2 (2003) (331), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (90, Fig. 54).

Derivation (Clifford & Bostock 2007): *L. spica*, thorn; *forma*, appearance. Inflorescence a condensed spike-like panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs. Leaf-blades erect, flat or involute, 15–30 cm long, 1–3 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear or oblong, 10–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 2 mm long, pubescent, pungent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 4 mm long, 0.5 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate, awned, 1 -awned, awn 10–12 mm long. Upper glume linear, 8–10 mm long, 1.6 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate, awned, 1 -awned, awn 10–12 mm long.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 20–30 mm long limb, with twisted column. Column of lemma awn 10–30 mm long. Lateral lemma awns present, spreading as much as principal, 20–30 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, Mississippi, South Carolina. **Caribbean.** Cuba, Puerto Rico.

Aristida spuria Domin. *Biblioth. Bot.* 1, 5: 241 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: NT: *S. T. Blake 8349*, 30 Mar 1935, Australia: Queensland: North Kennedy Dist.: Castle Hill, Townsville (BRI; INT: AD, B, BO, CANB, CBG, DNA, EA, K, L, LAE, MBA, MEL, MO, NOU, NSW, NT, PERTH, PRE, QRS, SP, SRGH, US). NT designated by Simon, *Austr. Syst. Bot.* 5: 150 (1992).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler, *Grasses of New South Wales*, 4th edn (2008) (132), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(3)), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (153, Fig. 23).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 151, Fig.1 (1992)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. spuriosus*. The lateral awns of the lemma are insignificant or absent, the spikelets then resembling those of *Stipa*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms decumbent, 20–91 cm long. Culm-internodes smooth, distally glabrous. Culm-nodes glabrous. Lateral branches fastigiata. Leaf-sheaths striately veined, smooth or scaberulous, glabrous on surface or pilose. Leaf-sheath oral hairs lacking or ciliate, 1–2 mm long. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades curled or flexuous, filiform, involute, 8–12 cm long, 0.5 mm wide. Leaf-blade surface smooth or scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 11–29 cm long, 0.9–1 cm wide. Primary panicle branches 2 -nate, 4–6.5 cm long. Panicle branches scaberulous or scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–1.3 mm long, pubescent, acute. Floret callus hairs 1–1.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–13 mm long, 0.9–1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower

glume primary vein scabrous. Lower glume surface smooth or asperulous, glabrous or pilose. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1.5 mm long. Upper glume lanceolate, 6.5–13 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume surface glabrous or pilose. Upper glume apex dentate, 2 -fid, acute or acuminate, awned, 1 -awned, awn 2.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 7–12.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scaberulous. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn geniculate or 3-branched, with 6–20 mm long limb, with twisted column, persistent. Column of lemma awn 4–9 mm long. Lateral lemma awns absent or present, 0–4 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 1.1–1.7 mm long. Caryopsis with adherent pericarp, sulcate on hilar side, 4.8–8 mm long. Hilum linear, 0.3 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Queensland. North, Central, South East, Inland. Western Slopes.

Aristida stenophylla Henrard. *Meded. Herb. Leid.* No. 54 a. 587 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somaliland: Da Obba a Wuarandi, Jul-Aug 1891, *Robecchi Briccheti s.n.* (HT: FI).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (83, Fig 34).

Derivation (Clifford & Bostock 2007): Gk. *stenos*, narrow; *phyllon*, leaf. Leaf-blades filiform.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 30–40 cm long, wiry. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 7–20 cm long, 0.5–1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 5–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, pubescent, with longer hairs above, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse or acute, mucicous or mucronate. Upper glume lanceolate, 14–20 mm long, 3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex entire or dentate, 2 -fid, obtuse or acute, mucicous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–55 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 10–20 mm long. Lateral lemma awns present, 35–55 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa. Ethiopia (inc. Eritrea), Somalia. Kenya.

Aristida stenostachya W. D. Clayton. *Bol. Soc. Argent. Bot.* 12: 111 (1968).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Tanzania. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Saranda-Manyoni: Burt 5393 (K holotype).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *stenos*, narrow; *stachys*, ear of corn. Inflorescence a narrow spike or spike-like panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–120 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades convolute, 20–60 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, continuous or interrupted, 25–30 cm long, 1–2 cm wide. Panicle branches glabrous in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–19 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–19 mm long, 1–1.1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, acute, mucronate or awned, awn 0–2 mm long. Upper glume lanceolate, 10–19 mm long, 1–1.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, mucronate or awned, 1 -awned, awn 0–2 mm long.

Florets. Fertile lemma elliptic, subterete, 10–13 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scaberulous. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 20–30 mm long limb, without a column or with a straight or slightly twisted column, persistent. Column of lemma awn 0–4 mm long. Lateral lemma awns present, 20–30 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa, East Tropical Africa, South Tropical Africa. Somalia. Kenya, Tanzania. Zambia.

Aristida stipitata Hack. *Verh. Bot. Ver. Brand.* 143. (1888).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Namibia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *H. Schinz* 658, Feb 1886, Namibia: Omatope (K, PRE, US-81250, W (US, photo), Z).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984) (as subspecies *stipitata*, *graciliflora*, *robusta*, *spicata*).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. *stipes*, stalk; *-ata*, possessing. Pedicels long.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–150 cm long, 4–6 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades flat or involute, 5–30 cm long, 2–4 mm wide, glaucous. Leaf-blade surface scaberulous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted or spiciform, linear, continuous or interrupted, 10–25 cm long. Primary panicle branches appressed or ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 18–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–3 mm long, bearded, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–13 mm long, 0.6 length of upper glume, chartaceous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex setaceously

acuminate. Upper glume lanceolate, 18–22 mm long, 2.2–2.5 length of adjacent fertile lemma, chartaceous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex entire or dentate, 2 -fid, attenuate, awned, 1 -awned, awn 1–5 mm long.

Florets. Fertile lemma elliptic, subterete, 8–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface punctate. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 25–60 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 20–40 mm long. Lateral lemma awns present, 25–60 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. South Tropical Africa, Southern Africa. Angola, Mozambique, Zambia, Zimbabwe. Namibia, Botswana, Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Free State, Kwazulu-Natal, Northern Cape.

Aristida stipoides Lam. *Encycl.* 1: 157 (1783).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Senegal. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Roussillon s.n.*, Senegal (P-LAM).

Illustrations (Books): M.A.N.Muller, *Grasses of South West Africa/Namibia* (1984).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. With spikelets resembling those of *Stipa*..

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 90–150 cm long. Culm-internodes distally glabrous. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades flat or involute, 15–30 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, equilateral or nodding, 20–50 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pilose, 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5–7 mm long, 0.3–0.4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 14–20 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex obtuse.

Florets. Fertile lemma elliptic, subterete, 7–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 35–60 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 15–30 mm long. Lateral lemma awns present, 30–50 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. West Tropical Africa, Northeast Tropical Africa, East Tropical Africa, South Tropical Africa, Southern Africa. Guinea, Mali, Mauritania, Nigeria, Senegal, Niger. Sudan. Tanzania. Angola, Zambia, Zimbabwe. Namibia, Botswana.

Aristida stocksii (Hook.f.) Domin. *Biblioth. Bot.* 1, 5: 338 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Aristida funiculata* var. *stocksii* Hook. f., *Fl. Brit. India* 7:227 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Stocks s.n.*, Concan (K).

Illustrations (Books): G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Fig. 202).

Derivation (Clifford & Bostock 2007): in honor of John Ellerton Stocks (1822–1854) English-born physician and plant collector in India.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms 10–20 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades convolute, 2–6 cm long, 1–2.5 mm wide, stiff. Leaf-blade surface ribbed. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 7–9 cm long. Panicle branches with scattered hairs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 22–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 22–25 mm long, 3.5–4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 3 mm long. Upper glume linear, 6 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma elliptic, subterete, 5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 60–70 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 20 mm long, pubescent. Lateral lemma awns present, 60–70 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Gujarat, Karnataka. Maharashtra.

Aristida stricta Michx. *Fl. Bor. Am.* 1: 41. (1803).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from USA. **Basionym or Replaced Name:** *Aristida beyricheana* Trin. & Rupr., *Mem. Acad. Petersb. Ser.* 6 (7) 104. (1849). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Michaux s.n.*, USA: in Carolina (P-MICHX; IT: P, US-81246 (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (336).

Images: R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): L. erect. Inflorescence branches erect.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long. Culm-internodes distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades flexuous, involute, 30–40 cm long, 1–2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous, hairless except near base.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 25–35 cm long. Primary panicle branches appressed, 2–5 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 7–9 mm long, 1 length of upper glume, membranous, 1–2 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent or distinct. Lower glume apex setaceously acuminate. Upper glume linear,

7–9 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn ascending or spreading, with 10–15 mm long limb. Lateral lemma awns present, spreading as much as principal, 8–12 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Southeastern USA. Alabama, Florida, Georgia, Mississippi, North Carolina, South Carolina.

Aristida strigosa (Henrard) S. T. Blake. *Trans. Roy. Soc. S. Austral.* 67: 45 (1943).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Aristida calycina* var. *strigosa* Henrard, *Med. Rijks Herb. Leiden* 58 A :297 (1932). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *R. Helms* 23, 15 May 1891, Australia: South Australia: Arkaringa Creek, Elder Exploring Expedition (K (photo, BRI); IT: AD, BRI, BRI (fragm. ex K), MEL). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 708 (1933).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (329, Fig 262), C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (167, Pl 49), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (132), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (106(32)), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (113, Fig 19), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. covered with short, bristle-like hairs. One or more organs covered with bristle-like hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–120 cm long, 3–6 -noded. Culm-internodes scaberulous, distally glabrous. Lateral branches sparse. Leaf-sheaths longer than adjacent culm internode, striately veined, scaberulous or antrorsely scabrous. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs, 0.5–1 mm long. Collar glabrous. Leaf-blades 9–18 cm long, 2–3 mm wide. Leaf-blade surface scabrous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 16–36 cm long, 1.5–3 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–10 mm long, 0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth to scabrous. Lower glume apex acute to setaceously acuminate. Upper glume lanceolate, 7–12 mm long, 0.8–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or acute, mucous or mucronate.

Florets. Fertile lemma lanceolate, subterete, 8.5–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 13–26 mm long limb, without a column, persistent. Lateral lemma awns present, 12–20 mm long, subequal to principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 5–8 mm long. Hilum linear, 0.5 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland, South Australia, Western Australia.

Ereman. Central Australia. NW & Lake Eyre. Inland. Western Plains.

Aristida subaequans Doell. Mart. *Fl. Bras.* 2, 3:19. (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *W.J. Burchell 5025 pro parte*, no date, Brazil: Sao Paulo (S; IT: BR, K, US-81245 (fragm. ex Dvll herb, Freiburg), W).

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms 60–80 cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking. Ligule a ciliolate membrane, 0.2 mm long. Collar glabrous. Leaf-blades straight, flat (generally) or convolute, 35–40 cm long, 3–4.5 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, smooth.

Inflorescence. Inflorescence a panicle. Panicle spiciform, 14–16 cm long. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 1 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower longer than upper). Lower glume lanceolate, 8–13(–15) mm long, 1 -veined. Lower glume surface scabrous, rough generally. Lower glume apex acuminate, muticous. Upper glume lanceolate, 10–20 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acuminate.

Florets. Fertile lemma subterete, 10–11 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, with a median groove (ventral,longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn curved, reflexed, simple at base, with 25 mm long limb (from x to 25), without a column. Lateral lemma awns present, spreading as much as principal, 25 mm long (from x to 25), subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast. Catarina, Rio Grande do Sul. Sao Paulo.

Aristida subspicata Trin. & Rupr. *Sp. Gram. Stipac.* 125–126. 1842.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Macrae s.n.*, Ecuador: Galapagos: Albemarle Island (LE; IT: CGE, K, US-991975, US-81244 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sub*, approaching; *spica*, spike; -ata, possessing. Inflorescence a spike-like panicle.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 20–50 cm long, 2–3 -noded. Culm-internodes terete, smooth or scaberulous. Lateral branches lacking or sparse. Leaf-sheaths mostly shorter than adjacent culm internode, keeled, scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Collar glabrous. Leaf-blades filiform or linear, flat or convolute, 5–20 cm long, 0.5–3 mm wide. Leaf-blade midrib keeled beneath. Leaf-blade venation distinct. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, exerted or embraced at base by subtending leaf. Peduncle pubescent above to hirsute above. Panicle spiciform, linear or oblong, 6–15 cm long. Primary panicle branches 1 -nate. Panicle axis terete or angular, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume surface glabrous or hispidulous. Lower glume apex acuminate, awned, 1 -awned, awn 1–3 mm long. Upper glume lanceolate, 6–7 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 2–3 mm long.

Florets. Fertile lemma oblong, subterete, 3–4 mm long, coriaceous, keeled, lightly keeled, 3 -veined, 0–3 -veined. Lemma surface smooth or papillose, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb, with twisted column, deciduous, abscissing from top of column. Column of lemma awn 1.5–4 mm long. Lateral lemma awns present, 12–15 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Marquesas. **Western South America.** Galapagos.

Aristida subulata Henrard. *Meded. Herb. Leid.* No. 54 a. 612 (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Castellanos s.n. [*herb. Lorenzo R. Parodi no. 1839*], 8 Jan 1927, Argentina: La Pampa: Maracs (L-927.250–232; IT: BAA-17/117, US-1447540 (also fragm. ex L)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (42), M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (478, Fig 321).

Illustrations (Journals): *Darwiniana* (41: 183, fig.10 (2003)).

Derivation (Clifford & Bostock 2007): L. *subulus*, a fine point; *-ata*, possessing. Glumes, lemmas or calluses sharply tapered.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–50 cm long, 2–4 -noded. Lateral branches sparse. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Collar glabrous. Leaf-blades filiform, convolute, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–15 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12.5–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 9–12 mm long, 0.75–0.85 length of upper glume, membranous. Lower glume primary vein scabrous. Lower glume apex acute. Upper glume linear, 10.5–14 mm long, membranous. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 12–13 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface asperulous, rough above. Lemma margins involute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 3.5–4 mm long limb. Lateral lemma awns present, 3.5–4 mm long, subequal to principal.

Flower and Fruit. Caryopsis with adherent pericarp, fusiform, light brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Southern South America.** Argentina Northwest, Argentina Northeast, Argentina South.

Catamarca, Mendoza, San Luis, Tucuman. Buenos Aires, Cordoba, La Pampa. Río Negro.

Aristida succedanea Henrard. *Meded. Herb. Leid.* 54 C. Suppl., 740 (1933).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: A. Lvfgren 242, 21 Nov 1907, Brazil: Sao Josi dos Campos (S; ILT: RB). LT designated by Henrard, *Meded. Rijks-Herb.* 54(C): 741 (1933).

Illustrations: None found.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms (27–)35–50(–90) cm long. Lateral branches lacking. Leaf-sheath oral hairs scanty or bearded (innovations). Ligule a ciliolate membrane, 0.2–0.5 mm long. Collar glabrous. Leaf-blades straight, flat (generally), (15–)18–25(–30) cm long, (1.5–)2–3 mm wide. Leaf-blade surface scabrous (ventral) or scaberulous (dorsal), rough on both sides, glabrous. Leaf-blade apex acute, smooth.

Inflorescence. Inflorescence a panicle. Panicle contracted (subcontracted), 10–18(–23) cm long. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.5–0.6 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper, sometimes subequal, rarely lower slightly longer than upper). Lower glume lanceolate, (6.2–)7–10.5 mm long, 1 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex obtuse or cuspidate, mucous. Upper glume lanceolate, 7.2–11 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, obtuse or cuspidate.

Florets. Fertile lemma subterete, 9–10.5 mm long (beaked), without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface scaberulous, rough above, with a median groove (ventral, longitudinal). Lemma margins involute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 22–28(–35) mm long limb, without a column. Lateral lemma awns present, ascending, 18–22(–32) mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Western South America (Bolivia). Bolivia. Brazil Southeast. Sao Paulo.

Aristida superpendens Domin. *Biblioth. Bot.* 1, 5: 339 (1915).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: K. Domin s.n., Feb 1910, Australia: Queensland: Cook Dist.: in den Savannenwaldern bei Mareba (L (2 sheets; photo, BRI); IT: BRI).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), K.Domin, *Bibliotheca Botanica* 85 (1915) (Pl.13).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 155, Fig.2 (1992)).

Derivation (Clifford & Bostock 2007): L. *super*, above; *pendeo*, hang. Spikelets pendulous in upper part of spikelet.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 60–120 cm long. Culm-internodes antrorsely scabrous, distally glabrous. Leaf-sheaths scaberulous or antrorsely scabrous, glabrous on surface. Leaf-sheath oral hairs ciliate, 4–5 mm long. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades curled, filiform or linear, involute, 15–27 cm long, 0.6–1.2 mm wide. Leaf-blade surface scaberulous or scabrous, rough on both sides, pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 14–34 cm long, 5–8 cm wide. Primary panicle branches 2 -nate, 2–5 cm long. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 16–21 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.6–2.2 mm long, pubescent, pungent. Floret callus hairs 0.2–1.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–13.2 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute or acuminate, awned, 1 -awned, awn 1.5 mm long. Upper glume lanceolate, 16–21 mm long, 1.6–2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 1.5 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–12.6 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, spreading, with 35–99 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 11–34 mm long. Lateral lemma awns present, spreading less than principal, 26–86 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 5.6–7.2 mm long. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. Malesia, Papuaia. Moluccas. New Guinea PNG. New Guinea. **Australia.** Northern Territory, Queensland. Darwin & Gulf. North.

Aristida suringarii Henrard. *Meded. Rijks-Herb.* 616–618, f. 1928.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Netherland Antilles. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *W.F.R. Suringar 1885*, 11 May 1885, Netherlands Antilles: St. Eustatius (L-908.84–1084; IT: US-81242 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of W.F.R. Suringar (fl. 1885) who collected in Antilles.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 50–60 cm long. Culm-internodes striate, smooth. Lateral branches ample. Leaf-sheaths mostly shorter than adjacent culm internode, striately veined, smooth, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 10–15 cm long, 0.5–1 mm wide. Leaf-blade surface scaberulous, rough on both sides, glabrous or pilose, sparsely hairy, hairy abaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, loose, 20 cm long. Primary panicle branches appressed or ascending, 1–2 -nate. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5 mm long, pilose, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 4–5 mm long, 0.7–0.8 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume linear, 5.5–6.5 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, 15 mm long overall. Lateral lemma awns present, 15 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Windward Islands, Venezuelan and Netherlands Antilles.

Aristida swartziana Steud. *Syn. Pl. Gram.* 137 (1854).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Jamaica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: NT: *Swartz s.n.*, *Sabulosis aridis Jamaicae australis* (S; INT: M-4876). NT designated by Henrard, *Meded. Rijks-Herb.* 54: 618–619 (1928).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Olof Peter Swartz (1760–1818) Swedish botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 40–70 cm long. Lateral branches lacking. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades erect, involute, 15–30 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 5–15 cm long. Primary panicle branches ascending, 1–3 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.5 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 7 mm long, 0.9 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume linear, 8 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 8 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, with this appendage 1 mm long, awned, 3 -awned. Principal lemma awn 3-branched, with 15–25 mm long limb. Lateral lemma awns present, spreading less than principal, 15–25 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Northern South America, Western South America. Aruba, Bahamas, Dominican Republic, Haiti, Jamaica, Leeward Is, Windward Islands, Puerto Rico, Venezuelan and Netherlands Antilles. Venezuela. Bolivia, Ecuador, Galapagos, Peru.

Aristida takeoi Ohwi. *Bot. Mag., Tokyo*, 45: 183. (1931).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Liukiu; Chibana in Nakaku-sugori, 12 Sep 1930, *T. Ito* (HT: KYO).

Illustrations (Books): T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (214, Fig 77).

Derivation (Clifford & Bostock 2007): in honor of Takeo.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms erect, slender, 40–60 cm long, 0.5–0.7 mm diam., 3 -noded. Leaf-sheaths tight, mostly shorter than adjacent culm internode, glabrous on surface. Ligule a fringe of hairs. Leaf-blades filiform, involute, 15–20 cm long, 0.3–0.7 mm wide, stiff. Leaf-blade surface scabrous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 15–20 cm long. Primary panicle branches appressed, 1–2 -nate, 5–9 cm long. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–8.5 mm long, 0.75 length of upper glume, chartaceous, 1-keeled, 3 -veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, 1.2–1.3 length of adjacent fertile lemma, chartaceous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 8–9 mm long, coriaceous, light green, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 18–20 mm long limb, with twisted column. Column of lemma awn 11–13 mm long. Lateral lemma awns present, 13–16 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Nansei-Shoto.

***Aristida tarapotana* Mez. Fedde, *Repert.* 17: 151 (1921).**

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Tarapoto, Peru.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–40 cm long. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 10–23 cm long, 1 mm wide, stiff.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10–12 mm long, 1 length of upper glume, membranous. Lower glume apex dentate, 2 -fid. Upper glume linear, 10–12 mm long, 1.2 length of adjacent fertile lemma, membranous. Upper glume apex dentate, 2 -fid.

Florets. Fertile lemma linear, subterete, 8.5–10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 20–24 mm long limb. Lateral lemma awns present, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

***Aristida tenuifolia* Hitchcock. *Proc. Calif. Acad. Sc. Ser.* 4, 21: 296 (1935).**

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.T. Howell 8361*, 23 Mar 1932, Mexico: Colima; among rocks on ridge above Sulphur Bay, Clarion Island, Revillagigedo Islands (CAS; IT: US-1611672).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. tenuis*, slender; folium, leaf. Leaf-blades narrow.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 60 cm long, 1 mm diam. Leaf-sheaths without keel, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades involute, 10–20 cm long, 1–1.5 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins cartilaginous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–20 cm long. Primary panicle branches appressed, 5 cm long. Panicle axis scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, reaching apex of florets or exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 1 length of upper glume, membranous, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex setaceously acuminate. Upper glume lanceolate, 10–11 mm long, membranous, 3 -veined. Upper glume lateral veins obscure. Upper glume surface smooth. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 10 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface asperulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 10–15 mm long limb, with a straight or slightly twisted column. Column of lemma awn 2–3 mm long. Lateral lemma awns present, 10–15 mm long, subequal to principal.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico. Colima.

Aristida tenuiseta T.A. Cope. *Kew Bull.* 47(2): 278 (1992).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia: mudug: 1 km S of Obbia, 4 Jun 1987, *Wieland 4439* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. tenuis*, weak; seta, bristle. Awns filiform.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–30 cm long. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 8–20 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 9–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 21–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–9.5 mm long, 0.4 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex dentate, 2 -fid, awned, 1 -awned, awn 2–3 mm long. Upper glume lanceolate, 21–23 mm long, 3.5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 7–10 mm long.

Florets. Fertile lemma oblong, subterete, oblong in profile (cylindrical), 6–6.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 95–105 mm long limb, with twisted column, deciduous, abscising from top of lemma. Column of lemma awn 12–25 mm long. Lateral lemma awns present, 95–105 mm long, subequal to principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.
Country /Province /State. Northeast Tropical Africa. Somalia.

Aristida tenuissima A. Camus. *Bull. Soc. Bot. France* 79: 844 (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Madagascar centr.: mont Belamboamy, *Perrier de la Bathie* 10.866.

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (119, Fig 37).

Derivation (Clifford & Bostock 2007): L. slender; *-issima*, most. Inflorescence slender.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 10–50 cm long, 0.3–0.5 mm diam. Culm-internodes distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths striately veined, glabrous on surface or pilose. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 2–12 cm long, 0.5–0.8 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 3–8 cm long, bearing few spikelets. Primary panicle branches 1–2 -nate, bearing 1–3 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, truncate.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3–4.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 4–6.5 mm long, 1–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex truncate, mucronate.

Florets. Fertile lemma lanceolate, subterete, 4–5 mm long, coriaceous, mid-green or purple, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 1 -awned or 3 -awned. Principal lemma awn geniculate or 3-branched, with 8–10 mm long limb, with twisted column, persistent. Column of lemma awn 3–4 mm long. Lateral lemma awns absent or present, when present 3–5 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Aristida teretifolia Arech. *Anal. Mus. Montevid.* 4, 1: 79. (1902).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Arechavaleta s.n.*, Nov 1899, Uruguay: campos gramíneos (MVM; IT: W-22193).

Illustrations (Books): B.Rosengurt, *Gramineas Uruguayas I* (1970) (217, Fig. 89).

Derivation (Clifford & Bostock 2007): L. *teres*, narrow; *folium*, leaf. Leaf-blades narrow and generally rigid.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Culms erect or geniculately ascending, 20–40 cm long, 1 -noded. Culm-internodes smooth. Lateral branches lacking. Leaf-sheaths smooth. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Collar glabrous. Leaf-blades straight or curved, aciculate, convolute, 5–12 cm long, 1–1.5 mm wide, coriaceous, stiff. Leaf-blade venation with 9 secondary veins. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex obtuse.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 10–15 cm long. Primary panicle branches appressed or ascending, 2 -nate, 3–8 cm long, bearing 5–10 fertile spikelets on each lower

branch. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 16–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 0.66 length of upper glume, membranous, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 16–17 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, awned, 1 -awned, awn 1.5–2.5 mm long.

Florets. Fertile lemma linear, subterete, 10–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scaberulous. Lemma surface smooth or granulose. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 30–35 mm long limb. Lateral lemma awns present, 30–35 mm long, subequal to principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil South. Catarina, Rio Grande do Sul.

Aristida ternipes Cav. *Ic. 5: 46. (1799).*

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Nie* 532, Nov, Panama (MA; IT: F (photo ex MA), MEXU (photo ex MA), US-81240 (fragm.)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (325 as var. *ternipes* & *gentilis*), R.McVaugh, *Flora Nova-Galiciana* Vol.14 *Gramineae* (1983), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (89, Fig. 52), W.Burger, *Flora Costaricensis* 15, *Gramineae: Fieldiana Botany New Series* 4 (1980) (54, Fig 13), G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 41, Fig. 7 (1997)).

Derivation (Clifford & Bostock 2007): *L. terni*, three each; *pes*, foot. Lemma terminating in a three-branched awn.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 50–150 cm long, 1.5–4 mm diam., with 0.4–0.5 of their length below uppermost node. Culm-internodes solid, distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades flat or involute, 25–50 cm long, 3–5 mm wide. Leaf-blade surface ribbed, scaberulous, glabrous, hairless except near base. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 25–50 cm long. Primary panicle branches 1 -nate. Panicle axis scabrous. Panicle branches scabrous. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–1 mm long, pilose, acute. Floret callus hairs 2–3 mm long.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume linear, 6.5–11.5 mm long, 0.8 length of upper glume, membranous, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acute, awned, 1 -awned, awn 1–2 mm long. Upper glume linear, 8–12 mm long, 0.5 length of adjacent fertile lemma, membranous, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile lemma linear, subterete, 15–22.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned or 3 -awned.

Principal lemma awn curved, 10–15 mm long overall, with 10–15 mm long limb, without a column. Lateral lemma awns absent or present, 0–3 mm long, shorter than principal. Palea 0.5–1.3 mm long.

Flower and Fruit. Anthers 3, 2.7 mm long. Caryopsis with adherent pericarp, linear, 7–8.5 mm long. $2n = 22$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Aristida thompsonii B.K. Simon. *Austrobaileya* 4(2): 145 (1994).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Queensland: North Kennedy District: 9.5 km W of Homestead, 20.21S 114.531E, 30 Aug 1992, E.J. Thompson & P.R. Sharpe CHA232 (HT: BRI; IT: AD, CANB, DNA, K).

Illustrations (Books): K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (77, Fig 13), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Edward John Thompson (1949-) Australian ecologist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–40 cm long, 1–1.5 mm diam., 3–4 -noded. Culm-internodes glaucous, smooth, distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, striately veined, smooth, glabrous on surface. Ligule a fringe of hairs. Collar glabrous. Leaf-blades involute, 10–25 cm long, 0.5–0.75 mm wide, stiff, glaucous. Leaf-blade surface scaberulous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–10 cm long, 0.3 cm wide. Primary panicle branches appressed, 1–2 cm long, bearing spikelets almost to the base. Panicle branches scaberulous, with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse. Floret callus hairs 0.7 mm long.

Glumes. Glumes lower deciduous, upper persistent, similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–6 mm long, 0.9 length of upper glume, membranous, 1 -veined. Lower glume lateral veins absent. Lower glume surface asperulous. Lower glume apex acute. Upper glume lanceolate, 6–7 mm long, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume surface asperulous. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 5.5–6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 3.5–4 mm long limb. Lateral lemma awns present, 0.5–1 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, linear, 4.5 mm long. Embryo 0.25 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland. Central.

Aristida torta (Nees) Kunth. *Enum. Pl.* 1: 190. (1833).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Chaetaria torta* Nees, *Agrost. Bras.* 386 (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *K.F.P. von Martius s.n.*, no date, Brazil: Minas Gerais (M; IT: K (photo), LE-TRIN-1360.01 (fragm. & fig.), US-865706 (fragm. ex M & photo)).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (283, Fig. 57), S.A.Renvoize, *The Grasses of Bahia*, 1984 (51, Fig. 17), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (32, Fig. 13), E.Judziwicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (67, Fig 8).

Derivation (Clifford & Bostock 2007): *L. torqueo*, twist. Awn twisted.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 42–90 cm long. Lateral branches lacking. Leaf-sheath oral hairs scanty or bearded (deciduous hairs). Ligule a ciliolate membrane, 0.2 mm long. Collar glabrous. Leaf-blades straight, conduplicate, 8.5 cm long or 2–40 cm long, 1.5–4 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, sparsely hairy, hairy adaxially (at margins). Leaf-blade apex obtuse, smooth.

Inflorescence. Inflorescence a panicle. Panicle contracted (or subcontracted), 9–30 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, straight, 0.2 mm long, pilose, obtuse.

Glumes. Glumes persistent, dissimilar (lower generally shorter than upper, sometimes subequal or lower longer than upper). Lower glume lanceolate, 7.5–9 mm long, 1 -veined. Lower glume primary vein scabrous. Lower glume surface scabrous, rough on veins. Lower glume apex acute, muticous or awned (shortly). Upper glume lanceolate, 4.5–8 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acute, muticous or awned (shortly).

Florets. Fertile lemma subterete, 3.5–5 mm long, without keel, rounded throughout, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn curved, recurved at base of limb (generally), simple at base, with 7–17 mm long limb, without a column. Lateral lemma awns present, ascending, 5–11.5 mm long (1/3–2/3 the length of the principal awn), shorter than principal (conspicuously).

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America, Brazil. Belize, Costa Rica, Honduras, Nicaragua, Panama. French Guiana, Guyana, Surinam, Venezuela. Bolivia, Colombia, Ecuador, Peru. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil North.

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Lorenzo R. Parodi 8140*, Jan 1927, Argentina: La Pampa: General Acha, in campis graminosis (L-927.250–231; IT: US-1447539 (also fragm. ex L)).

Illustrations (Books): M.N.Correa, *Flora Patagonica* Parte III, Gramineae (1978) (473, Fig. 318), F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (43).

Derivation (Clifford & Bostock 2007): Gk. *trachys*, rough; *anthos*, flower. Lemmas scabrid.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 35 cm long, 2–3 -noded. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Collar pilose. Leaf-blades convolute, 1–3 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 8–9.5 mm long, 0.66 length of upper glume, membranous. Lower glume apex acute. Upper glume linear, 13–15 mm long, membranous. Upper glume apex dentate, 2 -fid, acute, muticous or mucronate.

Florets. Fertile lemma linear, subterete, 10–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins involute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn straight, with 35–37 mm long limb. Lateral lemma awns present, 35–37 mm long, subequal to principal.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest, Argentina Northeast, Argentina South.

Aristida transvaalensis Henrard. *Meded. Herb. Leid.* No. 58 A. 235 (1932).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *C.E. Moss 14259*, 3 Apr 1927, South Africa: Transvaal; prope Pretoria, Baviaanspoort (K). LT designated by Henrard, *Meded. Rijks-Herb.* 54: 743 (1933).

Illustrations (Books): L.K.A. Chippindall, *Grasses and Pastures of South Africa* (1955) (310, Fig 275).

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From the Transvaal, South Africa.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 35–70 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches ample. Ligule a fringe of hairs. Leaf-blades filiform, convolute, 7–15 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 4–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–11.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pilose, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5–9 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein smooth or scaberulous. Lower glume lateral veins absent. Lower glume apex acute, awned, 1 -awned. Upper glume lanceolate, 6.5–10 mm long, -0.6–0.8 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein smooth or scaberulous. Upper glume lateral veins absent. Upper glume apex truncate, mucronate.

Florets. Fertile lemma elliptic, subterete, 10–11.5 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface granulose. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 6–13 mm long limb, with twisted column, persistent. Column of lemma awn 1–6 mm long. Lateral lemma awns present, 1–8 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, linear.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Limpopo, North-West, Gauteng, Mpumalanga, Swaziland, Kwazulu-Natal.

Aristida tricornis H. Scholz & P. Konig. *Willdenowia* 17: 111 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Saudi Arabia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bairle & Kvnig 28-1667*, Saudi Arabia: 50 km NW Khamis Mushayt (B).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. tria*, three; *cornu*, horn. Awn terminally divided into three short segments.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 5–20 cm long. Ligule a fringe of hairs. Leaf-blades involute, 1–5 cm long, 1 mm wide, coriaceous, stiff. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or oblong, 2–8 cm long, contracted about primary branches. Primary panicle branches appressed or ascending, simple, 1–2 cm long, bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pubescent, with longer hairs above, acute.

Glumes. Glumes persistent, similar, reaching apex of florets or shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4.5–6.5 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 5.5–7 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough in lines. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn spreading, flat below (0.5–0.6mm wide), stiff, pungent, with 10–20 mm long limb, without a column, persistent. Lateral lemma awns present, spreading as much as principal, 8–15 mm long, shorter than principal. Palea without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Arabian Peninsula. Saudi Arabia, Yemen.

Aristida trisetata Keng. *Sunyatsenia* 6: 102 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: on dry site, Shaowusze Agricultural station, Taining district, Sikang province, *K.L. Chu 7477*.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 636).

Derivation (Clifford & Bostock 2007): *L. tria*, three; *seta*, bristle. Awn trifid.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 12–22 cm long, 0.5–1 mm diam., 1–2 -noded. Leaves mostly basal. Leaf-sheaths loose, 2.5–4 cm long. Leaf-sheath oral hairs lacking or ciliate. Ligule a fringe of hairs, 0.2 mm long. Leaf-blades involute, 3.5–7 cm long, 1–2 mm wide, glaucous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 3.5–7.5 cm long. Primary panicle branches 1–2 -nate, bearing 2–4 fertile spikelets on each lower branch. Panicle axis scaberulous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 1–10 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 6–8 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acuminate. Upper glume lanceolate, 7–10 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scabrous. Upper glume lateral veins absent. Upper glume surface smooth or asperulous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 6.5–8 mm long, coriaceous, dark brown or black, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn straight, with 4–8 mm long limb, persistent. Lateral lemma awns present, 0.5–3.5 mm long, shorter than principal. Palea 1.5–2 mm long, 0.2 length of lemma, 2 -veined, without keels. Palea apex obtuse.

Flower and Fruit. Lodicules 2, 1.2 mm long, veined, glabrous. Anthers 3, 3–3.5 mm long. Caryopsis with adherent pericarp, fusiform, sulcate on hilar side, 5 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central, Qinghai, Tibet. Gansu. Sichuan, Yunnan.

Aristida triticoides Henrard. Meded. Herb. Leid. No. 54 C. Suppl., 744 (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Somalia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Somalia: Appleton 104 (K holo).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (83, Fig 34).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Triticum* usually with reference to the inflorescence.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect or geniculately ascending, 30–65 cm long. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades convolute, 15–30 cm long, 1–1.5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 6–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1 mm long, pilose, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–8 mm long, 0.4–0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute or acuminate, mucronate. Upper glume lanceolate, 14–16 mm long, 3.5–5 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–5 mm long.

Florets. Fertile lemma elliptic, subterete, 3–4.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 40–60 mm long limb, with twisted column, deciduous, abscissing from top of column. Column of lemma awn 20–25 mm long. Lateral lemma awns present, 25–35 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Northeast Tropical Africa. Somalia. **Western Asia, Arabian Peninsula.** Iran. Oman, Saudi Arabia. **Indian Subcontinent.** India, Pakistan.

Aristida tsangpoensis L. Liou. *Fl. Xizangica* 5: 82 (1987).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nang Xian: Qinghai-Xizang Complex Exped. 7896 (HP holo).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 635).

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–30 cm long, 0.5–1 mm diam., 1–2 -noded. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades involute, 3–6 cm long, 1–2 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–7 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 9–12 mm long, 1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, subterete, 7–9 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 10–12 mm long limb, with twisted column, persistent. Column of lemma awn 2 mm long. Lateral lemma awns present, 7 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, Tibet. Yunnan.

Aristida tuberculosa Nutt. *Gen. Am.* 1: 57. (1818).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: in the sandy pine forests of Georgia, a few miles from Augusta.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (320).

Derivation (Clifford & Bostock 2007): *L. tuberculus*, wart; *-osa*, abundance. Lemmas or glumes bearing warty projections.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Butt sheaths villous. Culms erect, 24–50 cm long. Lateral branches ample, arising from lower culm. Leaf-sheaths glabrous on surface, outer margin glabrous or hairy. Ligule a fringe of hairs. Leaf-blades involute, 10–20 cm long, 1–3 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 10–20 cm long. Primary panicle branches ascending, 2 -nate. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3–4 mm long, pubescent, pungent.

Glumes. Glumes similar, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Lower glume linear, 6–12 mm long, 1 length of upper glume, membranous. Lower glume apex acute,

awned, 1 -awned, awn 3–6 mm long. Upper glume linear, 6–12 mm long, membranous. Upper glume apex acute, awned, 1 -awned, awn 3–6 mm long.

Florets. Fertile lemma linear, subterete, 11–13 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, spreading or recurved at base of limb, with 20–40 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 10–15 mm long. Lateral lemma awns present, spreading as much as principal, 30–40 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. North-central USA, Northeast USA, Southeastern USA. Illinois, Wisconsin. Maine, New Hampshire, New York. Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina.

Aristida tuitensis J.G. Sanchez-Ken & P. Davila. *Novon* 5(2): 190 (1995).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Jalisco: Mun. El Tuito, 9 a 10 km sobre la brecha a las Minas del Cuale (E de El Tuito), elev. 1900 m, 13 Jan 1991, J. Sanchez-Ken, M. Mayfield & B. Westlund 500 (HT: MEXU; IT: ENCB, IBUG, MICH, MO).

Illustrations (Journals): *Novon* (5:191, Fig.1 (1995)).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Municipio El Tuito, Mexico.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 1–2 mm diam., 9–15 -noded. Culm-internodes terete, 2–12 cm long, distally glabrous. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths 3–9 cm long, longer than adjacent culm internode, indistinctly veined, glabrous on surface. Ligule a fringe of hairs, 0.2–0.3 mm long. Leaf-blades straight or flexuous, flat, 10–50 cm long, 2–4 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Peduncle 11–30 cm long, smooth or scaberulous above. Panicle open, ovate, effuse, 14–35 cm long, 12–20 cm wide, with spikelets clustered towards branch tips. Primary panicle branches spreading, 9–15 cm long. Panicle branches with prominent pulvini. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present, 5–18 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–7.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.7–1 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4–8 mm long, 0.7–0.9 length of upper glume, membranous, 3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins obscure. Lower glume surface glabrous. Lower glume apex acute, mucronate or awned, 1 -awned, awn 0.5–2 mm long. Upper glume lanceolate, 6–7.5 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex obtuse, mucronate or awned, 1 -awned, awn 0.5–1 mm long.

Florets. Fertile lemma linear, subterete, 4.5–6 mm long, 1–1.3 mm wide, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, with twisted column. Column of lemma awn 6–10 mm long. Palea 0.5–0.7 mm long.

Flower and Fruit. Lodicules 2, 1–1.2 mm long. Anthers 3, 3–4 mm long.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico.

Jalisco.

Aristida uruguayensis Henrard. *Meded. Herb. Leid.* No. 54 E. 647 (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Sello s.n.*, Sep 1823, Uruguay: San Josi do Uruguay (B).

Illustrations (Books): A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (215, Fig. 79 & as var. *uruguayensis*), B.Rosengurtt, *Gramineas Uruguayas I* (1970) (214, Fig. 88), F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (44, var. *laevis* & var. *uruguayensis*).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Uruguay.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 27–50(–73) cm long. Lateral branches lacking. Leaf-sheath oral hairs lacking. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curved, conduplicate, 15–35 cm long or 0 cm long, 1.8 mm wide or 0.2–3.2 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acute, antrorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, 15–24(–28) cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.7–0.8 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, (13–)17–21 mm long, 1(–3) -veined (lateral veins free). Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex setaceously acuminate. Upper glume lanceolate, 27–37(–40) mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, acuminate.

Florets. Fertile lemma laterally compressed, 13–18 mm long, keeled, distinctly keeled, keeled above, 3 -veined, 0–3 -veined. Lemma midvein without distinctive roughness or scabrous. Lemma surface smooth, without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 75–130 mm long limb, without a column. Lateral lemma awns present, ascending, 75–130 mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Argentina Northeast, Uruguay. Santiago del Estero. Buenos Aires, Cordoba, Corrientes, Entre Rios.

Aristida utilis Bailey. *Qld Agric. J.* 18:340 (1907).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M. Webb s.n.*, May 1907, Australia: Queensland: Cook District: near Cooktown (BRI; IT: K (photo, US-1447336), US-1162453).

Illustrations (Books): J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(5)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 151, Fig.1 (1992)).

Derivation (Clifford & Bostock 2007): L. useful. Peduncles used for manufacture of hats.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 53–130 cm long. Culm-internodes smooth or scaberulous, distally pubescent. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth or scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 1.5–3 mm long. Ligule a fringe of hairs, 0.3–0.5 mm long. Leaf-blades curled or flexuous, involute, 10–21 cm long, 1.5–2 mm wide. Leaf-blade surface smooth or scaberulous, glabrous or pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–48 cm long, 1–6 cm wide. Primary panicle branches 2–3 -nate, 4–8.5 cm long, naked below or bearing spikelets almost to the base. Panicle branches scabrous, glabrous or pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, compressed slightly, 8–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4–0.7 mm long, pubescent, acute. Floret callus hairs 1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7.3–16 mm long, 0.9 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate, awned, 1 -awned, awn 2.5–4 mm long. Upper glume lanceolate, 8.3–17 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate, awned, 1 -awned, awn 2.5–4 mm long.

Florets. Fertile lemma lanceolate, subterete, 8–20 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scabrous, rough above, glabrous or pubescent, hairy above. Lemma margins involute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn geniculate or 3-branched, with 9–31 mm long limb, with twisted column, persistent. Column of lemma awn 5–9 mm long, glabrous or puberulous. Lateral lemma awns absent or present, 0–10 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, sulcate on hilar side. Hilum linear, 0.25 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. Papuaia. New Guinea PNG. New Guinea. **Australia.** Northern Territory, Queensland.

Darwin & Gulf. North, South East.

Aristida vagans Cav. *Ic. 5: 45. t. 471. (1799).*

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Anon. s.n.*, Australia: New South Wales: Central Coast, Port Jackson (MA (photo, BRI)).

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,, *Grasses of New South Wales*, 4th edn (2008) (132), J.C.Tothill,& J.B.Hacker. *The grasses of southern Queensland* (1983) (104(19)), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (155, Fig. 24).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 197, Fig.11 (1992)).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. vago*, wander. Culms much branched.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 38–85 cm long, 2–3 -noded. Culm-internodes smooth, distally glabrous. Lateral branches lacking or sparse or ample. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs, 0.5 mm long. Collar glabrous. Leaf-blades flat or involute, 5–10 cm long, 1 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–11.5 cm long, 3–4 cm wide. Primary panicle branches 2–5 cm long. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, pubescent, acute.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.5–7 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex cuspidate. Upper glume lanceolate, 3.5–7 mm long, 0.4–0.6 length

of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate or obtuse.

Florets. Fertile lemma lanceolate, subterete, 8.5–12 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 6–9.5 mm long limb, without a column, persistent. Lateral lemma awns present, 4–8 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 6–9 mm long. Hilum linear, 0.3–0.4 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Queensland. Central, South East. Coast, Tablelands, Western Slopes, Western Plains.

Aristida vaginata Hitchc. *Proc. Calif. Acad. Sci., ser. 4*, 21(24): 297. 1935.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.T. Howell 8448*, 29 Mar 1932, Mexico: Colima: dry slopes, north anchorage, Socorro Island, Revillagigedo Islands (CAS-211474; IT: US-1611669).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. vagina*, sheath; -ata, possessing. Leaf-sheaths conspicuous.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100 cm long, 2.4 mm diam. Leaf-sheaths tight, wider than blade at the collar, without keel, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a fringe of hairs. Leaf-blades flat, 1–3 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially, glabrous, hairless throughout or except near base. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 30 cm long. Primary panicle branches appressed, 5–8 cm long. Panicle axis scabrous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, winged, with this appendage 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10 mm long, 0.9 length of upper glume, membranous, 3 -veined. Lower glume surface scabrous. Lower glume apex setaceously acuminate. Upper glume lanceolate, 11 mm long, membranous. Upper glume surface asperulous. Upper glume apex setaceously acuminate.

Florets. Fertile lemma linear, subterete, 6–7 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn geniculate, with 20–35 mm long limb, with a straight or slightly twisted column, persistent. Column of lemma awn 2–3 mm long. Lateral lemma awns present, 20–35 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico. Colima, Jalisco.

Aristida valida Henrard. *Meded. Herb. Leid.* No. 54 E. 655 (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L.R. Parodi 6902*, 25 Jan 1926, Argentina: Misiones: Apsstoles, in campis altis, forma grandes matas on campos altos, comzn (L-926.156–888; IT: US-1295684 (also fragm. ex L)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. robust.* Culms erect, stout.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, robust, 70–80 cm long, 1.5 mm diam. Culm-internodes smooth. Leaf-sheaths 20 cm long, smooth or scaberulous. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs. Leaf-blades filiform, conduplicate or involute, 10–20 cm long, 0.75 mm wide. Leaf-blade surface scabrous, rough on both sides. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–30 cm long, contracted about primary branches. Primary panicle branches appressed or ascending, 2-nate, 4–8 cm long. Panicle axis scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 18–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 10.5–13.5 mm long, 0.66 length of upper glume, membranous, 1-veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute, awned, 1-awned, awn 2 mm long. Upper glume linear, 18–23 mm long, membranous, 1-veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute, awned, 1-awned, awn 2 mm long.

Florets. Fertile lemma linear, subterete, 11–13 mm long, coriaceous, purple, without keel, 3-veined, 0–3-veined. Lemma margins convolute, covering most of palea. Lemma apex with a short cylindrical neck, awned, 3-awned. Principal lemma awn 3-branched, with 40–70 mm long limb. Lateral lemma awns present, ascending or gyrate, 40–70 mm long, subequal to principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast, Paraguay.

Misiones.

Aristida venesuelae Henrard. *Meded. Herb. Leid.* No. 54 E. 659 (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela: in savannis ad Caracas, 1891–1892, *Dr. E. Warming s.n.* (HT: C).

Illustrations (Books): G.Harling & C.Persson, *Flora of Ecuador* (2006) (57: 50, Fig. 9 (1997)).

Derivation (Clifford & Bostock 2007): from Venezuela.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations intravaginal. Culms erect, 11–24 cm long, 1 mm diam. Culm-internodes scaberulous. Lateral branches lacking or sparse. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs pubescent. Ligule a fringe of hairs. Leaf-blades convolute, 8–10 cm long, 2 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15 cm long, contracted about primary branches. Primary panicle branches 1–2-nate. Panicle axis scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 2–5 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.75 mm long, pubescent, acute.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 1.2–1.3 length of upper glume, membranous, 1-veined. Lower glume primary vein scabrous.

Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 6–7 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 6–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 20 mm long limb. Lateral lemma awns present, 10–15 mm long, shorter than principal.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia, Ecuador, Peru.

Aristida venustula Arech. Anal. Mus. Montevid. 4, 1: 77. (1902).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Uruguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Arechavaleta s.n.*, Uruguay: Montevideo: vive en campos gramíneos (MVM; IT: BAA, W-22185).

Illustrations (Books): A.Burkart, *Flora Ilustrada de Entre Ríos (Argentina)*, Pt II, Gramineas (1969) (215, Fig. 80), B.Rosengurt, *Gramineas Uruguayas I* (1970) (217, Fig. 89), F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina 3 – 1, Aristidoideae a Pharoideae* (2012) (45).

Derivation (Clifford & Bostock 2007): *L. venusta*, beautiful; -ula, diminutive.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Culms 20–35(–45) cm long. Lateral branches lacking. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs, 0.2 mm long. Collar glabrous. Leaf-blades curved, conduplicate, 5–18 cm long, 0.5–0.8(–1.2) mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous or pilose, hairless except near base, sparsely hairy, hairy adaxially. Leaf-blade apex acute, antorsely scabrous.

Inflorescence. Inflorescence a panicle. Panicle open (pauciflore), 8–20 cm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 0.7–1 mm long, pilose, acute (subacute).

Glumes. Glumes persistent, dissimilar (lower shorter than upper). Lower glume lanceolate, (11–)14–19 mm long, 3–5 -veined (lateral veins convergent with the central). Lower glume primary vein scabrous. Lower glume surface asperulous, rough generally. Lower glume apex acuminate or setaceously acuminate. Upper glume lanceolate, (17–)20–33 mm long, 1 -veined. Upper glume surface smooth. Upper glume apex entire, setaceously acuminate.

Florets. Fertile lemma laterally compressed (slightly), 11–18 mm long, keeled (slightly ABOVE), 3 -veined, 0–3 -veined. Lemma midvein scabrous. Lemma surface smooth or scabrous, rough above (2/3), without grooves. Lemma margins convolute. Lemma apex awned, 3 -awned. Principal lemma awn straight, ascending, simple at base, with 55–90(–100) mm long limb, without a column. Lateral lemma awns present, ascending, 55–90(–100) mm long, subequal to principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America, Western South America (Bolivia). Bolivia. Brazil South. Argentina Northeast, Paraguay, Uruguay.

Catarina, Rio Grande do Sul. Tucuman. Buenos Aires, Chaco, Cordoba, Corrientes, Entre Ríos, Misiones.

Aristida venustuloides Arech. Anal. Mus. Montevid. 4, 1: 77. (1902).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.E. Burkart & S. Crespo 22900, 21 Dec 1961, Argentina: Entre Ríos: Colon Dept.: arroyo Palmar, Ruta 14, km 380 (SI; IT: US-2595187).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (var. *venustula* & var. *venusutoides*), A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (215, Fig 80).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Aristida venustula*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial. Basal innovations extravaginal or intravaginal. Culms erect, 35–40 cm long, with 0.1–0.2 of their length below uppermost node. Leaf-sheaths longer than adjacent culm internode. Leaf-sheath oral hairs ciliate, 3 mm long. Ligule a fringe of hairs. Leaf-blades filiform, conduplicate, 4–15 cm long, 1–1.5 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 6–10 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 20–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.75 mm long, acute.

Glumes. Glumes dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–12 mm long, 0.5 length of upper glume, membranous, 3–7 -veined. Lower glume apex acuminate. Upper glume lanceolate, 20–22 mm long, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 11–13 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn with 50–65 mm long limb. Lateral lemma awns present, 50–65 mm long, subequal to principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast. Entre Rios.

Aristida vestita Thunb. *Prod. Pl. Cap.* 19. (1794).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from South Africa. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Thunberg s.n.*, South Africa: Cape (UPS).

Illustrations: None found.

Images: F.van Oudtshoorn, *Guide to Grasses of Southern Africa* (1999).

Derivation (Clifford & Bostock 2007): L. *vestio*, clothe. Leaf-blades and, or hairy.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous or woolly. Culms 40–120 cm long. Culm-internodes distally pubescent or woolly. Leaf-sheath oral hairs woolly. Ligule a fringe of hairs. Leaf-blades flat or convolute, 20–40 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, 15–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1 mm long, pilose, truncate or 2-toothed.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4.5–7 mm long, 0.5 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 9–13 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex emarginate.

Florets. Fertile lemma elliptic, subterete, 7–11 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 20–35 mm long limb, with twisted column, deciduous, abscissing from top of lemma. Column of lemma awn 2–7 mm long. Lateral lemma awns present, 15–30 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. East Tropical Africa, South Tropical Africa, Southern Africa. Tanzania, Mozambique, Zambia, Zimbabwe. Namibia, North-West, Mpumalanga, Free State, Northern Cape, Western Cape, Eastern Cape.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. vexatio*, trouble; *-iva*, indicating capacity.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 15–30 cm long, 0.5 mm diam. Lateral branches lacking. Leaf-sheaths tight, striately veined, glabrous on surface. Leaf-sheath oral hairs pubescent or ciliate. Ligule a fringe of hairs. Leaf-blades flexuous, conduplicate, 1 mm wide, glaucous. Leaf-blade surface scaberulous, rough adaxially or on both sides. Leaf-blade margins unthickened. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 15 cm long. Primary panicle branches appressed, 2-nate, 2–4 cm long. Panicle axis smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 19–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 9–10 mm long, 0.5 length of upper glume, membranous, 1-veined. Lower glume primary vein ciliolate. Lower glume lateral veins absent. Lower glume apex awned, 1-awned. Upper glume linear, 19–20 mm long, 2 length of adjacent fertile lemma, membranous, 1–3-veined. Upper glume primary vein smooth. Upper glume lateral veins absent or obscure. Upper glume apex acuminate, awned, 1-awned.

Florets. Fertile lemma linear, subterete, 8–11 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3-awned. Principal lemma awn with 70 mm long limb. Lateral lemma awns present, 70 mm long, subequal to principal. Palea hyaline, 0-veined.

Flower and Fruit. Lodicules 2. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast. Santa Fe.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: New South Wales: South Far Western Plains: between Euston and Gol Gol, 15 Oct. 1949, J. W. Vickery (HT: NSW-144387; IT: BRI).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (132), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 207, Fig.13 (1992)).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of Joyce Winifred Vickery (1908–1979) Australian botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–45 cm long, 2–4 -noded. Culm-internodes smooth, distally glabrous. Lateral branches sparse. Ligule a fringe of hairs, 0.3–0.7 mm long. Leaf-blades flexuous, filiform, involute, 4–16 cm long, 0.5 mm wide. Leaf-blade surface scabrous, rough adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 12–15 cm long, 3–5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.2 mm long, pubescent, pungent. Floret callus hairs 1.2 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute or acuminate. Upper glume lanceolate, 12–13 mm long, 1.2–1.3 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 10 mm long, coriaceous, pallid or light brown, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough above. Lemma margins involute or convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn with 33–37 mm long limb, without a column, persistent. Lateral lemma awns present, 30–35 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3, 2 mm long. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales.
Western Plains.

Aristida victoriana Sulekic. *Darwiniana* 41(1–4): 184 (-186; fig. 11). 2003 (2003).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Argentina. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Rodeo Pampa: Sulekic & Cano 1929 (ICN holo).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (46).

Illustrations (Journals): *Darwiniana* (41: 185, fig.11 (2003)).

Derivation (Clifford & Bostock 2007): L. -*ana*, indicating connection. From Depto. Santa Victoria, Argentina.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 6–20 cm long. Leaf-sheaths striately veined, scaberulous, glabrous on surface. Leaf-sheath oral hairs ciliate, 1.5 mm long. Ligule a fringe of hairs, 0.3 mm long. Leaf-blades straight or curved, convolute, 1–7 cm long, 0.5–2 mm wide, stiff. Leaf-blade surface scaberulous or scabrous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, interrupted, 3–8 cm long, 0.4–0.7 cm wide, bearing few spikelets. Primary panicle branches naked below or bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, angular, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.6 mm long, pilose, obtuse.

Glumes. Glumes similar, with lower wider than upper, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 5.5–8.5 mm long, 0.9–1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute, mucicous or mucronate. Upper glume lanceolate, 6–9.5 mm long,

0.9–1 length of adjacent fertile lemma, membranous, 1 -veined. Upper glume lateral veins absent. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 1–1.3 mm long.

Florets. Fertile lemma linear, subterete, 6.5–8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn 3-branched, with 3.5–7.5 mm long limb, with a straight or slightly twisted column. Column of lemma awn 1.5–2.8 mm long. Lateral lemma awns present, ascending, 2–5 mm long, shorter than principal, lemma awns 0.66 length of principal. Palea 1.5–1.7 mm long, 2 -veined. Palea apex dentate, 2 -fid.

Flower and Fruit. Lodicules 2, 1–1.3 mm long. Anthers 3. Caryopsis with adherent pericarp, fusiform, without sulcus, 3.5–5.5 mm long, dark brown. Embryo 0.2–0.33 length of caryopsis. Hilum linear.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northwest.
Salta.

Aristida vilfifolia Henrard. Meded. Herb. Leid. No. 54 E. 671 (1928).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman [Amer. Gr. Nat. Herb. 791]*, 21 Oct 1922, Cuba: Camaguey, savanna (L-925.70–13; IT: US-1161263).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. folium*, leaf. Leaf-blades like those of *Vilfa*.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 30–60 cm long, wiry. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades curved or flexuous, flat or involute, 3–5 cm long, 0.5–1 mm wide. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 5–15 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 6–8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pubescent, pungent.

Glumes. Glumes similar, reaching apex of florets, thinner than fertile lemma. Lower glume linear, 6–8 mm long, 1 length of upper glume, membranous, 1 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume linear, 6–8 mm long, membranous, 1 -veined. Upper glume primary vein smooth. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 6–7 mm long, coriaceous, 3 -veined, 0–3 -veined. Lemma margins convolute, covering most of palea. Lemma apex awned, 3 -awned. Principal lemma awn spreading, with 10–15 mm long limb. Lateral lemma awns present, spreading less than principal, 6–10 mm long, shorter than principal.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Bahamas, Cuba, Dominican Republic, Haiti.

Aristida villosa B.L. Rob. & Greenm. *American Journal of Science* 50: 144. 1895.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G. Baur 337*, Aug 1891, Ecuador: Galapagos: Jervis Island (GH; IT: US-81233 (fragm. ex GH & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 15–35 cm long, 3–6-noded. Culm-internodes terete, distally pubescent. Culm-nodes flush with internodes, glabrous. Lateral branches lacking or sparse. Leaf-sheaths mostly shorter than adjacent culm internode, hirsute. Leaf-sheath oral hairs bearded. Ligule a fringe of hairs. Collar glabrous or pubescent. Leaf-blades flat or convolute, 5–12 cm long, 2.5–3 mm wide, glaucous. Leaf-blade surface scaberulous, rough on both sides, pubescent, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 4–7 cm long. Primary panicle branches 1-nate. Panicle axis pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 4 mm long, membranous, 1-keeled, 3-veined. Lower glume primary vein scaberulous. Lower glume lateral veins obscure. Lower glume surface asperulous, rough on veins, glabrous or puberulous. Lower glume apex acuminate, awned, 1-awned, awn 2 mm long. Upper glume lanceolate, 6 mm long, membranous, 1-keeled, 1-veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume surface puberulous. Upper glume apex dentate, 2-fid, awned, 1-awned, awn 2–3 mm long.

Florets. Fertile lemma ovate, subterete, 4 mm long, coriaceous, without keel, 3-veined, 0–3-veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3-awned. Principal lemma awn 3-branched, with 9–15 mm long limb, with a straight or slightly twisted column, deciduous, abscissing from top of column. Column of lemma awn 1 mm long. Lateral lemma awns present, 5–6 mm long, shorter than principal.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Galapagos.

Aristida warburgii Mez. Fedde, *Repert.* 17: 149 (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*.

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.F. Warburg 19535*, no date, Australia: Queensland: Wide Bay Dist.: near Maryborough (B; IT: BRI (fragm. & photo ex B), US-2489454 (fragm. ex B)). Collection no. is annotated on sheet, but not cited in publication.

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (133), J.C.Tothill, & J.B.Hacker. *The grasses of southern Queensland* (1983) (104(10)), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austr. Syst. Bot.* (5: 188, Fig.9 (1992)).

Derivation (Clifford & Bostock 2007): in honor of Otto Warburg (1859–1938) German botanist.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–90 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate or bearded. Ligule a fringe of hairs, 0.3 mm long. Collar glabrous or pubescent. Leaf-blades filiform, involute, 8–16 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 11–15 cm long, 2–7 cm wide. Primary panicle branches 10–22 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8.5–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.2–2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 7–11.5 mm long, 0.7–0.8 length of upper glume, membranous, 1-keeled, 3–7-veined. Lower glume apex obtuse. Upper glume lanceolate, 8.5–17 mm long, 1.2–1.5 length of adjacent fertile

lemma, membranous, 1-keeled, 1–3 -veined. Upper glume lateral veins absent or obscure. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, subterete, 7–11 mm long, coriaceous, pallid or light brown, mottled with last colour, without keel, 3 -veined, 0–3 -veined. Lemma surface smooth or scabrous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, reflexed, with 17–33 mm long limb, with twisted column, persistent. Column of lemma awn 5–17 mm long. Lateral lemma awns present, spreading less than principal, 12–28 mm long, shorter than principal. Palea 0.2 length of lemma, without keels.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp, 6–7 mm long. Hilum linear.

Distribution (TDWG). Continent. Tropical Asia, Australasia.

Country /Province /State. Papuaia. New Guinea PNG. New Guinea. **Australia.** New South Wales, Queensland.

North, South East. Coast, Tablelands, Western Slopes.

Aristida wildii Melderis. *Bol. Soc. Brot., Ser. 2*, 44: 283 (1970).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Botswana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Aha Hills: *Wild & Drummond 6948* (BM holo, K, SRGH).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Hiram Wild (d.1982), ex Chief Botanist, National Herbarium of Rhodesia and University of Rhodesia.

Classification. Subfamily Aristidoideae. Tribe: Aristideae.

Habit, Vegetative Morphology. Annual. Culms erect, 35–55 cm long, 3–4 -noded. Culm-internodes distally glabrous. Ligule a fringe of hairs. Leaf-blades convolute, 10–22 cm long, 1–1.5 mm wide. Leaf-blade surface pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, 20–22 cm long. Primary panicle branches spreading or reflexed, 1–2 -nate, 3–6 cm long, bearing 1–3 fertile spikelets on each lower branch. Panicle branches glandular (in axils), scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10.5–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5 mm long, pilose, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 7–9 mm long, 1.2 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 6–7.5 mm long, 0.6–0.7 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume apex erose, obtuse.

Florets. Fertile lemma elliptic, subterete, 10.5–11 mm long, coriaceous, keeled, 3 -veined, 0–3 -veined. Lemma surface scaberulous, rough above. Lemma margins convolute, covering most of palea. Lemma apex acute, awned, 3 -awned. Principal lemma awn 3-branched, with 11–16 mm long limb, persistent. Lateral lemma awns present, 6–13 mm long, shorter than principal. Palea 0.1 length of lemma, without keels.

Flower and Fruit. Anthers 3.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Southern Africa. Botswana.

Arrhenatherum album (Vahl) W. D. Clayton. *Kew Bull.* 16: 250 (1962).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Tunisia. **Basionym or Replaced Name:** *Avena alba* Vahl, *Symb. Bot.* 2: 24. (1791). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *s.n.*, Tunisia (LE). Herb. Schum. HT: *Vahl*, (C).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. white. Usually of spikelets, often due to the pale indumentum.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons present. Culms 50–125 cm long, swollen at the base, forming an ovoid corm or moniliform corms. Culm-nodes glabrous or bearded. Leaf-sheaths glabrous on surface or hirsute. Ligule an eciliate membrane, 1–5 mm long, lacerate. Leaf-blades 20–40 cm long, 4–8 mm wide. Leaf-blade surface scabrous, glabrous or hirsute.

Inflorescence. Inflorescence a panicle. Panicle open, linear, dense, 10–35 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated between glumes or elongated below proximal fertile floret. Rhachilla elongation 1.5–1.8 mm long (below floret). Floret callus pilose.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 6–8.3 mm long, 0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 9–11 mm long, 1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 7–10.5 mm long, chartaceous, much thinner above, pilose, hairy below, dentate, 2 -fid, acute or acuminate, awned. Awn of lower sterile floret dorsal, arising 0.1 way up back of lemma, geniculate, 15–25 mm long. Fertile lemma elliptic, 7–10.5 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma hairs 2–3 mm long. Lemma apex acuminate, muticous or mucronate or awned, 1 -awned. Principal lemma awn subapical, 0–5 mm long overall. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 3.3–4.7 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, 3.5–4 mm long.

$n = 7$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Northern Europe (*), Southwestern Europe.

Country /Province /State. : GB Aliens (Ryves et al). : Portugal, Spain. **Northern Africa.** Algeria, Libya, Morocco, Tunisia. **Western Asia.** Cyprus, Lebanon-Syria.

Arrhenatherum calderae A.Hansen. *Cuad. Bot. Canar.*, 14–15: 65 (1972).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 50–100 cm long, 3–4 -noded. Ligule an eciliate membrane, 3–4 mm long, erose, truncate or obtuse. Leaf-blades 10–20 cm long, 3–4 mm wide, glaucous. Leaf-blade surface scaberulous, rough abaxially. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 8–9 cm long. Primary panicle branches bearing 1–3 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 6.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -

veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 6.5 mm long, 1.1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret ovate, 7–8 mm long, 1 length of fertile lemma, chartaceous, much thinner above, 7 -veined, dentate, 2 -fid, awned. Awn of lower sterile floret dorsal, arising 0.1 way up back of lemma, geniculate, 15–18 mm long. Palea of lower sterile floret 5 mm long. Fertile lemma lanceolate, 7–8 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn subapical, straight, 3–6 mm long overall. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 4 mm long, pallid or yellow. Ovary pubescent all over. Caryopsis with adherent pericarp, lanceolate, 5 mm long, hairy all over.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Macaronesia. Canary Is.

Derivation (Clifford & Bostock 2007): L. taller. Culms taller than those of related species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–180 cm long, 3–5 -noded, not swollen at the base or swollen at the base, forming moniliform corms. Culm-nodes glabrous or pubescent. Leaf-sheaths without keel, smooth or scaberulous, glabrous on surface or pilose. Ligule an eciliate membrane, 0.5–2 mm long. Leaf-blades 10–40 cm long, 4–10 mm wide. Leaf-blade surface scaberulous, pilose, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or oblong, equilateral or nodding, 10–30 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform or linear, 1–10 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 7–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Floret callus pilose.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, (3–)4–6(–7) mm long, 0.6 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 7–11 mm long, 0.9–1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret ovate, 0.9 length of fertile lemma, chartaceous, much thinner above, 7 -veined, glabrous or pilose, hairy below, dentate, 2 -fid, awned. Awn of lower sterile floret dorsal (on lower third of lemma), geniculate, 10–20 mm long. Fertile lemma obovate, 7–10 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface glabrous or pilose, hairy below. Lemma apex dentate, 2 -fid, mucous or awned, 1 -awned. Principal lemma awn subapical, straight or geniculate, 2–10.5 mm long overall. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 3.7–5.2(–5.5) mm long. Ovary pubescent all over.

$2n = 28$ (7 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Tropical Asia, Australasia (*), Pacific, North America, South America.

Region. Northern Europe, Middle Europe, Southwestern Europe, Southeastern Europe, Eastern Europe.

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 253), N.L.Bor, *Gramineae* in K.H.Rechinger, *Flora Iranica*. No. 70/30 (1970) (Tab. 51), N.L.Bor, *Gramineae* in *Flora of Iraq* (1968) (326, Pl. 119).

Derivation (Clifford & Bostock 2007): in honor of Karl Georg Theodor Kotschy (1813–1866) Austrian botanist and traveller.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes elongated. Culms erect, 17–30(–100) cm long, 1–2 -noded, not swollen at the base or swollen at the base, forming an ovoid corm. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 1.5–2.5 mm long, truncate or obtuse. Leaf-blades 6–25 cm long, 1–4 mm wide. Leaf-blade surface smooth or scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate or oblong, dense, 6–15 cm long, 2–5 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, curved, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 12–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 1.5–2 mm long, pilose (hairs 5–7mm). Floret callus pilose.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 6.5–9 mm long, 0.5–0.66 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 12–13.5 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1 -veined. Upper glume lateral veins absent. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 13–15 mm long, chartaceous, much thinner above, 7 -veined, villous, dentate, 2 -fid, setaceously acuminate (lateral awns 1–2.5mm), awned. Awn of lower sterile floret dorsal, arising 0.1 way up back of lemma, geniculate, 25–40 mm long. Fertile lemma elliptic, 9–10 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface villous. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn subapical, 10–16 mm long overall. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 2.3–4.6 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, oblong.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Caucasus, Western Asia. Iran, Iraq.

Arrhenatherum longifolium (Thore) Dulac. *Fl. Hautes-Pyr.* 78 (1867).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Pseudarrhenatherum*).

Basionym or Replaced Name: *Avena longifolia* Thore, *Prom. Golfe Gascogne* 92 (1810)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *Unknown s.n.*, (L).

Recent Synonyms: *Pseudarrhenatherum longifolium* (Thore) Rouy, *Bull. Soc. Bot. France*, 68: 401, 402 (1922).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. longus*, long; folium, leaf. With long leaf-blades.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–120 cm long. Culm-nodes bearded. Leaf-sheaths pilose. Ligule an eciliate membrane, 1–2 mm long, pubescent on abaxial surface, truncate. Leaf-blades flat or convolute, 15–30 cm long, 2–5 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially, pilose. Leaf-blade margins scabrous. Leaf-blade apex hardened.

Inflorescence. Inflorescence a panicle. Peduncle scaberulous above. Panicle open, lanceolate, dense, 5–15 cm long. Primary panicle branches bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, tip widened.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Floret callus pilose. Floret callus hairs 0.1 length of lemma.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 5–6 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins obscure. Lower glume apex acuminate. Upper glume lanceolate, 6–7 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 7–9 mm long, chartaceous, much thinner above, pubescent, dentate, 2 -fid, acute or acuminate, awned. Awn of lower sterile floret dorsal, arising 0.66 way up back of lemma, geniculate, 7–9 mm long. Fertile lemma elliptic, 6–7 mm long, chartaceous, much thinner above, without keel, 5–7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acuminate, mucronate or awned, 1 -awned. Principal lemma awn subapical. Palea 4–5 mm long. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 3–4 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, oblong, dorsally compressed, sulcate on hilar side, 2.5–3 mm long. Embryo 0.1 length of caryopsis. Hilum linear, 0.33 length of caryopsis.

Distribution (TDWG). Continent. Europe, Africa.

Region. Southwestern Europe.

Country /Province /State. : France, Portugal, Spain. **Northern Africa.** Morocco.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980).

TYPE from Palestine. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Palestine: *Boissier* (G holo).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 252).

Derivation (Clifford & Bostock 2007): from Palestine.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 17–55(–100) cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 2–3 mm long, pubescent on abaxial surface, obtuse. Leaf-blades 5–22 cm long, 1.4–4.5 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 7–27 cm long, 2–6 cm wide. Primary panicle branches 3–4 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–15 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 11–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 1–2.5 mm long. Floret callus pilose.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 5.5–6.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate, 9–12 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 8–14 mm long, chartaceous, much thinner above, dentate, 2 -fid, acute or acuminate, awned. Awn of lower sterile floret dorsal, arising 0.1 way up back of lemma, geniculate, 20–28 mm long. Fertile lemma elliptic, 8.1 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acuminate, muticous or awned, 1 -awned. Principal lemma awn subapical, 4.5–6 mm long overall. Palea keels ciliolate.

Flower and Fruit. Anthers 3, 3.5–5.5 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp.

Arrhenatherum pallens (Link) Link. *Hort. Berol.* 1: 124. (1827).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980) (as *Pseudarrhantherum*).

Basionym or Replaced Name: *Avena pallens* Link, *J. Bot. (Schrader)* 2: 314 (1799).

Recent Synonyms: *Pseudarrhenatherum pallens* (Link) Holub, *Taxon* 15:167 (1966).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. pale. Inflorescences pale.

Classification. Subfamily Pooideae. Tribe: Poae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–70 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades filiform, convolute, 0.6–0.8 mm wide. Leaf-blade surface ribbed, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, dense, 5–12 cm long. Primary panicle branches bearing spikelets almost to the base. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 9–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Floret callus pilose.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume lanceolate, 7–8 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins obscure. Lower glume apex acuminate. Upper glume lanceolate, 9–10 mm long, 1.2 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, attached to and deciduous with the fertile. Lemma of lower sterile floret elliptic, 7–8 mm long, chartaceous, much thinner above, pubescent, dentate, 2 -fid, acute or acuminate, awned. Awn of lower sterile floret dorsal, arising 0.5–0.8 way up back of lemma, geniculate, 12–15 mm long. Fertile lemma elliptic, 7–8 mm long, chartaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acuminate, muticous or awned, 1 -awned. Principal lemma awn subapical, 0–2 mm long overall. Palea 6–7 mm long. Palea keels ciliate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe.

Region. Southwestern Europe.

Country /Province /State. : Portugal.

Arthrargrostis aristispicula B.K. Simon. *Austrobaileya* 2(3): 238 (1986).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Almaden: Simon 5598 & Clarkson (BRI holo, CANB).

Illustrations: None found.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. *arista*, bristle; *spica*, thorn; *-ula*, diminutive. Lemma shortly awned.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Annual. Culms 40–80 cm long. Ligule a ciliate membrane. Leaf-blades 2–9 cm long, 1–2.8 mm wide. Leaf-blade surface ribbed, pilose. Leaf-blade margins cartilaginous, ciliate, hairy at base.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–25 cm long, 2–5 cm wide. Primary panicle branches 5–12 cm long. Panicle axis bearing deciduous branches. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 6–7.5 mm long, 1–1.5 mm wide, falling entire. Rhachilla internodes elongated between glumes or elongated below proximal fertile floret. Rhachilla elongation slender.

Glumes. Glumes shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 3–4 mm long, 0.5–0.6 length of spikelet, membranous, without keels, 7 -veined. Lower glume apex obtuse or acute, mucronate. Upper glume elliptic, 5.5–7 mm long, 0.9 length of spikelet, membranous, without keels, 9–11 -veined. Upper glume lateral veins ribbed. Upper glume apex acuminate, awned, 1 -awned, awn 1–2 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1 length of spikelet, membranous, acuminate, awned. Awn of lower sterile floret 1–2 mm long. Fertile lemma elliptic, 1.5 mm long, indurate, pallid, shiny, without keel. Lemma margins involute. Palea indurate.

Flower and Fruit. Anthers 3. Hilum punctiform.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland. North.

Arthrargrostis brassiana B.K. Simon. *Austrobaileya* 8: 188 (2010).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cook District: Crest of Western Scarp of Great Dividing Range, 12 miles [19 km] E of The Lynd, 11 July 1954, *S.T.Blake 19478* (holo: BRI; iso: AD, CANB, DNA, K, L, MO, PERTH, PRE).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Annual. Culms 30–70 cm long, 3–5 -noded. Ligule a ciliate membrane, 0.5–0.7 mm long. Leaf-blades 3–9 cm long, 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–35 cm long. Primary panicle branches 3–10 cm long, bearing 5–10 fertile spikelets on each lower branch. Panicle axis bearing deciduous branches. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or ovate, dorsally compressed, 2–5.2 mm long, with hairs extending 0.6–1.5 mm beyond apex, falling entire. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation slender.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate or ovate, 0.5 length of spikelet, membranous, without keels, 3–5 -veined. Lower glume apex acute, muticous. Upper glume lanceolate or ovate, membranous, without keels, 5–7 -veined. Upper glume apex acute, muticous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1 length of spikelet, membranous, muticous. Fertile lemma elliptic, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse.

Distribution (TDWG). Continent. Australasia.

Arthrargrostis clarksoniana B.K. Simon. *Austrobaileya* 3(4): 585 (1992).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cook Dist.: 16 km from Meripah homestead on road to the south, 13.49S 142.22E, 11 May 1987, *J. R. Clarkson & B. K. Simon 7149* (HT: BRI-AQ452649; IT: MBA, NSW)

Illustrations (Books): D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Illustrations (Journals): *Austrobaileya* (3:586, Fig.1 (1992)).

Derivation (Clifford & Bostock 2007): In honor of John Richard Lindsay Clarkson (1950-) Scots-born Australian botanist.

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms erect or geniculately ascending, slender, 40–80 cm long, 2–4 -noded. Lateral branches sparse. Leaf-sheaths without keel. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades lanceolate, 3–10 cm long, 20 mm wide. Leaf-blade surface pilose. Leaf-blade margins smooth, tuberculate-ciliate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 23–30 cm long. Primary panicle branches spreading, 10–21 cm long, bearing 15–25 fertile spikelets on each lower branch. Panicle axis bearing deciduous branches. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–12 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, 3.5–4 mm long, falling entire. Rhachilla internodes elongated between glumes or elongated below proximal fertile floret. Rhachilla elongation slender.

Glumes. Glumes reaching apex of florets, thinner than fertile lemma. Lower glume elliptic or ovate, 3.5–4 mm long, 1 length of spikelet, membranous, without keels, 5–7 -veined. Lower glume surface pilose, hairy below, with tubercle-based hairs. Lower glume apex acuminate. Upper glume elliptic, 3.5–4 mm long, 1 length of spikelet, membranous, without keels, 7–9 -veined. Upper glume surface pilose, hairy below, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret elliptic, 3–3.5 mm long, 1 length of spikelet, membranous, acute. Fertile lemma elliptic, 1.5 mm long, chartaceous, yellow, shiny, without keel. Lemma margins involute. Palea chartaceous.

Flower and Fruit. Anthers 3. Caryopsis 1.5 mm long. Embryo 0.5 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory, Queensland. Darwin & Gulf. North.

Arthrargrostis deschampsoides (Domin) M. Lazarides. *Nuytsia* 5(2): 286 (1984).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland. **Basionym or Replaced Name:** *Panicum deschampsoides* Domin, *Biblioth. Bot.* 85: 230 (1915). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Domin 1208*, Feb 1910, Australia: Queensland: North Kennedy District (PR). Castle Hill, Townsville.

Illustrations: None found.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): Gk. *-oides* resembling. Resembling *Deschampsia*..

Classification. Subfamily Panicoideae. Tribe: Paniceae. Subtribe Panicinae.

Habit, Vegetative Morphology. Annual. Culms 17–50 cm long, 4 -noded. Ligule a ciliolate membrane, 0.5–0.8 mm long. Leaf-blades 2–9 cm long, 1–2.8 mm wide. Leaf-blade surface ribbed, hirsute, with tubercle-based hairs. Leaf-blade margins cartilaginous, ciliate, hairy at base.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–25 cm long, 2–5 cm wide. Primary panicle branches 5–12 cm long. Panicle axis bearing deciduous branches. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 8–25 mm long, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 4–5 mm long, falling entire. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation slender.

Glumes. Glumes dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.5 length of spikelet, membranous, without keels, 7 -veined. Lower glume surface scabrous. Lower glume

apex acute, mucicous or awned, 1 -awned, awn 0–1.5 mm long. Upper glume lanceolate, 3–4.5 mm long, membranous, without keels, 7 -veined. Upper glume lateral veins ribbed. Upper glume surface scabrous. Upper glume apex acuminate, mucicous or awned, 1 -awned, awn 0–2 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 1 length of spikelet, membranous, 9 -veined, ribbed, acuminate, mucicous or awned. Awn of lower sterile floret 0–2.5 mm long. Fertile lemma elliptic, 1.5–1.7 mm long, indurate, shiny, without keel, 5–7 -veined. Lemma margins involute. Lemma apex obtuse.

Flower and Fruit. Anthers 3, 1 mm long. Caryopsis with free brittle pericarp, dorsally compressed, 1.2–1.4 mm long. Embryo 0.5 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland. North.

Arthraxon antsirabensis A. Camus. *Bull. Soc. Bot. France* 95: 149 (1949).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Madagascar. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Madagascar, Andraraty: *Catal.* 370 ; Madagascar, Antsirabe: *Perrier 11155* .

Illustrations (Books): J.Bosser, *Graminees des Paturage et des Cultures a Madagascar* (1969) (213, Fig 76).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Antsirabi, Madagascar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, caespitose, clumped loosely. Culms decumbent, 15–90 cm long, rooting from lower nodes. Culm-nodes pubescent. Ligule a ciliolate membrane. Leaf-blade base amplexicaul. Leaf-blades lanceolate, 1.5–6 cm long, 4–15 mm wide. Leaf-blade surface pilose. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 3–6 cm long. Rhachis fragile at the nodes, glabrous on margins or ciliate on margins. Rhachis internodes filiform, 4 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 0.2–0.5 mm long.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6–7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 9 -veined. Lower glume surface scabrous, rough above. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 7 -veined. Upper glume surface scabrous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 2–2.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10–12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Western Indian Ocean. Madagascar.

Arthraxon castratus (Griff.) Nayaran. ex Bor. *Fl. Assam* 5: 376 (1940).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Andropogon castratus* Griff. *Not. Pl. Asiat.* 3: 89 (1851). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: "Suddyah in campis graminosis: January 2nd, 1836", *Griffith 292* (HT: K) IGS: "See Hack. Monog. 349."

Illustrations (Books): K.M.Mathew, *Illustrations on the Flora of Tamilnadu Carnatic* (1982) (Pl. 808 & 809), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (fig. 866).

Derivation (Clifford & Bostock 2007): *L. castro*, castrate. Sessile spikelet of pair only one present.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms rambling, 60–200 cm long. Culm-nodes glabrous. Leaf-sheaths hirsute, with tubercle-based hairs, outer margin hairy. Ligule a ciliate membrane, 1.7–2.2 mm long. Leaf-blades lanceolate, 4–11 cm long, 7–15 mm wide. Leaf-blade surface glabrous or pubescent. Leaf-blade margins ciliate.

Inflorescence. Inflorescence composed of racemes. Peduncle pubescent above. Racemes 1–5, single or paired or digitate, flexuous, 2–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 0.4–1.5 mm long. Rhachis internodes linear, 4–5.8 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2–3 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base obtuse, attached transversely. Spikelet callus hairs 0.4–1.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 7 -veined. Lower glume surface convex, scabrous, rough on veins. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 5.2–6.3 mm long, hyaline, ciliate on margins. Fertile lemma lanceolate, 4.4–5.3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10–14 mm long overall, with twisted column. Column of lemma awn 6–8 mm long, glabrous. Palea present, 2.3–2.8 mm long. Palea surface pubescent, hairy on flanks.

Flower and Fruit. Anthers 3, 2.4–3.7 mm long. Caryopsis with adherent pericarp, ellipsoid, 3.3 mm long.

$n = 9$ (1 ref TROPICOS). $2n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia, Australasia.

Country /Province /State. China. Hainan. Indian Subcontinent, Indo-China, Malesia. Assam, India, Sri Lanka. Myanmar, Thailand, Vietnam. Java. Australia. Queensland.

Assam, Manipur, Meghalaya. West Bengal. North.

Arthraxon cuspidatus (Hochst. ex A.Rich.) Hochst. ex Hack. DC., *Monog. Phan.* 6:353 (1889).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. **Basionym or Replaced Name:** *Andropogon cuspidatus* Hochst. ex A. Rich., *Tent. Fl. Abyss.* 2: 456 (1850). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *Schimper 1438*, 22 Sept 1840, Ethiopia: Tigray, Sana, Dscheladscheranne (P; IT: A, BM, K, L, US-1611426, US-865397 (fragm. ex W), W).

Recent Synonyms: *Arthraxon satarensis* Almeida, *Journ. Bombay Nat. Hist. Soc.* 66: 515 (1970).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (311, Fig 125).

Derivation (Clifford & Bostock 2007): *L. cuspis*, head of a spear; -ata, possessing. Glumes or lemmas long tapering or terminating in a sharp tip.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 40–45 cm long. Culm-nodes bearded. Lateral branches lacking or sparse. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule a ciliate membrane. Leaf-blade base cordate. Leaf-blades lanceolate, 3–7 cm long, 8–12 mm wide, flaccid. Leaf-blade surface pilose, sparsely hairy, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 4–5, digitate, 3–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs lengthening towards internode tip, 2–3 mm long. Rhachis internodes linear, 3 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3 mm long, villous, with 2–3 mm long hairs.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear or lanceolate, 4 mm long, shorter than fertile. Companion sterile spikelet glumes 3 -veined.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–7 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 9 -veined. Lower glume surface convex, muricate, rough on veins. Lower glume apex attenuate. Upper glume lanceolate, membranous, 1-keeled, keeled above, 3 -veined. Upper glume margins ciliolate. Upper glume apex setaceously acuminate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3–4 mm long, hyaline, 0 -veined, without midvein, without lateral veins, obtuse. Fertile lemma linear, hyaline, without keel, 2 -veined, 0–3 -veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 16 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.5 mm long.

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Northeast Tropical Africa. Ethiopia (inc. Eritrea). **Arabian Peninsula.** Oman. **Indian Subcontinent.** India.

Maharashtra.

Arthraxon depressus Stapf ex C. E. C. Fischer. *Kew Bull.* 1933, 349. (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: *Wight KD 3372* (K holo, CAL).

Illustrations (Books): K.M.Matthew, *Further Illustrations on the Flora of Tamilnadu Carnatic* (1988) (pl.715, pl.716).

Derivation (Clifford & Bostock 2007): L. broad and dwarf the growth having taken place horizontally. With spreading geniculate culms.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms rambling, slender, 30–60 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 2–2.8 mm long. Leaf-blade base broadly rounded. Leaf-blades lanceolate or ovate, 5–9 cm long, 10–26 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate.

Inflorescence. Inflorescence composed of racemes. Peduncle 17 cm long, glabrous or pubescent above. Racemes 2–4, digitate, 2–5.6 cm long. Rhachis fragile at the nodes, pubescent on surface. Rhachis internodes filiform, 3.5–4.6 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 2.2–3.5 mm long, pubescent.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets lanceolate, subterete, 6.8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled, 7 -veined. Lower glume surface scabrous or spinose, rough above. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 5.6 mm long, hyaline, 0 -veined, without midvein, without lateral veins, ciliolate on margins. Fertile lemma lanceolate, 4.8 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 9.5 mm long overall, with twisted column. Column of lemma awn 6 mm long, glabrous. Palea 2.5 mm long.

Flower and Fruit. Anthers 3, 3.4 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India. Tamilnadu.

Arthraxon echinatus (Nees) Hochst. *Flora* 39: 188 (1856).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 865).

Derivation (Clifford & Bostock 2007): *L. spiny*. Lower glume with abundant spicular hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 20–60 cm long, rooting from lower nodes. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths 1–2.25 cm long, glabrous on surface or pilose, with tubercle-based hairs. Ligule a ciliolate membrane. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 1.5–3.5 cm long, 5–12 mm wide, flaccid. Leaf-blade surface glabrous or pubescent. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1–5, single or paired or digitate, 2–4 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear, 3.5–3.75 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 0.6–0.75 mm long, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas, lanceolate, 4–4.5 mm long, shorter than fertile. Companion sterile spikelet glumes keeled, scabrous. Companion sterile spikelet lemmas 2, enclosed by glumes, mucous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5.5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, 5 -veined. Lower glume surface convex, spinose, rough on veins. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2.5–3 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 4–5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10–12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 2 mm long. Caryopsis with adherent pericarp.

$2n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent.** Assam, India, Nepal. Yunnan. Tamilnadu.

Arthraxon epectinatus B.S.Sun & H.Peng. *Guizh. Sci.* 9(4):289 (1991).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (fig. 867).

Derivation (Clifford & Bostock 2007): *L. e-*, without; *pecten*, comb; *-atus*, possessing. Differs from a related species by the absence of teeth on the lower glume margins.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms decumbent, 40–60 cm long. Culm-nodes bearded. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 6–9 cm long, 7–12 mm wide. Leaf-blade surface glabrous. Leaf-blade margins tuberculate-ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–6, digitate, 4–10 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear.

Sterile Spikelets. Companion sterile spikelets well-developed, lanceolate, 4.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 5–7 -veined. Lower glume surface convex, glabrous. Lower glume apex acuminate. Upper glume lanceolate, membranous, 1-keeled, keeled above. Upper glume margins ciliate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3.5 mm long, hyaline, 2 -veined, obtuse. Fertile lemma oblong, 4.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10 mm long overall, with a straight or slightly twisted column or with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 3.5 mm long, yellow. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **Arabian Peninsula, China.** China South Central, China North-Central.

Indian Subcontinent. Eastern Himalaya, Nepal.

Gansu, Shaanxi. Guizhou, Sichuan, Yunnan.

Derivation (Clifford & Bostock 2007): L. bearing coarse stiff hairs. Plant wholly or partly rough to the touch.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms rambling, slender, 15–50 cm long, 0.3–1 mm diam., rooting from lower nodes. Culm-internodes 1–6 cm long. Culm-nodes pubescent. Leaf-sheaths pilose, outer margin hairy. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blade base amplexicaul.

Leaf-blades ovate, 1–6 cm long, 8–25 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy on both sides. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–20, digitate, 2.5–5 cm long, 1–1.5 mm wide. Rhachis fragile at the nodes, glabrous on margins. Rhachis internodes filiform, 2–6 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 0.2–1 mm long, glabrous.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3–8 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, much thinner on margins, without keels, 7–9 -veined. Lower glume surface convex, spinose, rough on veins. Lower glume apex obtuse. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 0.66 length of spikelet, hyaline, 2 -veined, obtuse. Fertile lemma oblong, 2–6 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, muticous or awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 0–20 mm long overall, with a straight or slightly twisted column or with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.5–1 mm long. Caryopsis with adherent pericarp, oblong, 3.5–5 mm long.

$n = 18$ (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Europe (*), Africa, Temperate Asia, Tropical Asia, Australasia, Pacific, North America, South America.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. unarmed. Apices of lemmas or glumes rounded.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms rambling, 20–60 cm long, rooting from lower nodes. Lateral branches ample. Leaf-sheaths pilose. Ligule a ciliolate membrane. Leaf-blade base

amplexicaul. Leaf-blades lanceolate or ovate, 2–5 cm long, 4–12 mm wide, flaccid. Leaf-blade surface glabrous or pilose. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–6, digitate, 1.5–5 cm long. Rhachis fragile at the nodes, glabrous on margins. Rhachis internodes filiform, 2 mm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 2.5–3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 2.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 7–8 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1.5 mm long. Caryopsis with adherent pericarp.

$n = 18$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Maharashtra.

Arthraxon jubatus Hack. DC. *Monog. Phan.* 6: 358. (1889).

(Pl. 11).

Derivation (Clifford & Bostock 2007): L. *jubum*, mane; *-ata*, possessing. The inflorescence or awn resembles a fox tail.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms rambling, slender, 10–22 cm long. Culm-nodes pubescent. Leaf-sheaths pilose, with simple hairs or tubercle-based hairs. Ligule a ciliolate membrane, 0.4–0.7 mm long. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 1.4–3.9 cm long, 3–6 mm wide. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade margins ciliate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 2 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 4–5.1 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 1.7–2.6 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 3.9–5 mm long, shorter than fertile. Companion sterile spikelet glumes 4–7 -veined. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6–8.4 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pilose, base truncate, attached transversely. Spikelet callus hairs 1–1.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 2–4 -veined. Lower glume surface asperulous, rough on veins. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1.6–2.2 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 2.2–3.9 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 75–150 mm long overall, with twisted column. Column of lemma awn 18–46 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 0.7–1.3 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Maharashtra.

Arthraxon junnarensis Jain & Hemadri. *J. Bombay Nat Hist. Soc.*, 68 (1): 300 (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Poona district: *Hemadri 106849* (CAL holo, BSI, K, L, LE, MO).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Junnar, Maharashtra State, India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms rambling, weak, 10–20 cm long, rooting from lower nodes. Culm-nodes pubescent. Leaf-sheaths 0.5–1.75 cm long, pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 0.7 mm long. Leaf-blade base broadly rounded. Leaf-blades lanceolate or ovate, 1–2.5 cm long, 5–7.5 mm wide. Leaf-blade surface pilose, with tubercle-based hairs.

Inflorescence. Inflorescence composed of racemes. Peduncle 2–3 cm long, glabrous. Racemes 5–12, digitate, 1–1.75 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 1.25–1.8 mm long. Spikelets solitary. Fertile spikelets sessile. Pedicels present, filiform, 0.1–0.6 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 1.5–2 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous or pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate or ovate, 1 length of spikelet, chartaceous, without keels, 5 -veined. Lower glume lateral veins obscure. Lower glume surface scabrous, rough above. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume primary vein scabrous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 1 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex entire or dentate, 2 -fid, acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 4–5 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.3–0.5 mm long. Caryopsis with adherent pericarp, linear, 1.2 mm long.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent.** India.
Yunnan. Maharashtra.

Arthraxon lanceolatus (Roxb.) Hochst. *Flora* 39: 188. (1856).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Andropogon lanceolatus* Roxb., *Fl. Ind., ed. 1820* 1: 262 (1820). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Roxburgh Icon. Ined. 2019*, India (K, copy in L). LT designated by van Welzen, *Blumea* 27: 283 (1981).

Recent Synonyms: *Arthraxon deccanensis* Jain, *J. Bombay Nat. Hist. Soc.*, 68 (1): 297 (1971).

Illustrations (Books): G.E.Gibbs Russell et al, *Grasses of Southern Africa* (1990) (56, Fig 22 var. *lanceolatus*), K.M.Matthew, *Flora Palni Hills* (1996) (785, Pl 785), G.G.Potgar, C.B.Salunkhe &

S.R.Yadav, Grasses of Maharashtra (2012) (Fig. 8 as var. *lanceolatus*; Fig. 9 as var. *echinatus*; Fig. 10 as var. *meeoldii*, Fig. 12 as var. *villosus*).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Pl. 11,12).

Derivation (Clifford & Bostock 2007): *L. lanceus*, lance; *-ola*, diminutive; *-ata*, possessing. Mostly a reference to lanceolate leaf-blades.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Stolons present. Culms decumbent, 20–80 cm long. Culm-nodes glabrous. Ligule an eciliate membrane. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 1–5 cm long, 2–8 mm wide. Leaf-blade margins tuberculate-ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, paired or digitate, 2–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear, 2.5–3 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1–1.5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4–5 mm long, shorter than fertile. Companion sterile spikelet glumes keeled, 6–7 -veined. Companion sterile spikelet lemmas 2, enclosed by glumes, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled, 5–7 -veined. Lower glume lateral veins distinct. Lower glume surface flat, spinose, rough on flanks. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume surface scabrous, rough at apex. Upper glume margins ciliate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2–3 mm long, hyaline, 2–3 -veined. Fertile lemma lanceolate, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10–12 mm long overall, with twisted column. Column of lemma awn 5–6 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1–2 mm long. Caryopsis with adherent pericarp. $n = 15$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. Southern Africa. Limpopo, Mpumalanga. China. China South Central, China North-Central. Indian Subcontinent, Indo-China, Malesia. Assam. Laos, Thailand. Lesser Sunda Is, Malaya.

Shaanxi. Sichuan. Maharashtra.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Nepal. **Basionym or Replaced Name:** *Andropogon lancifolius* Trin. *Mem. Acad. Imp. Sci. St.-Petersbourg, Ser. 6, Sci. Math.* 2(4): 271 (1832). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal:, *Wallich 8828B* (LT: LE; ILT: A, K, L, W).

Illustrations (Books): G.V.Pope et al., *Flora Zambesiaca* 10 (4(2002):90, t. 29), S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (311, Fig 125), T.A.Cope, *Flora of Pakistan* 143: *Poaceae* (1982), H.J.Noltie, *The Grasses of Bhutan* (2000) (811, Fig. 59), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 869), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Fig.13).

Derivation (Clifford & Bostock 2007): *L. lanceus*, lance; *folium*, leaf. Leaf-blade lanceolate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms rambling, slender, 5–30 cm long. Ligule a ciliate membrane. Leaf-blade base cordate. Leaf-blades lanceolate or ovate, 1–4 cm long, 3–10 mm wide, flaccid.

Inflorescence. Inflorescence composed of racemes. Racemes 2–9, digitate, 1–2 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs lengthening towards internode tip, 1–2(–3) mm long. Rhachis internodes linear, 1 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 1–1.5 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed or represented by barren pedicels (rarely), lanceolate, 1–2(–3) mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear, laterally compressed, 2–3(–5) mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels. Lower glume surface convex, asperulous. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume apex acute, awned, 1 -awned, awn 0.5–1.5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, obtuse. Fertile lemma lanceolate, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 6–10 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.3–0.6 mm long.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Maoping, Guandong Province, China.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms 40–50 cm long. Culm-nodes bearded. Leaf-sheaths mostly shorter than adjacent culm internode, pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 1 mm long. Leaf-blade base cordate. Leaf-blades lanceolate or ovate, 3–5 cm long, 6–18 mm wide. Leaf-blade surface puberulous, hairy on both sides, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–5, digitate. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 0.5–0.8 length of fertile spikelet. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1 mm long.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 0.8 length of spikelet, chartaceous, much thinner above, much thinner on margins, purple, without keels, 5–7 -veined. Lower glume lateral veins obscure. Lower glume surface convex, asperulous, rough on veins. Lower glume apex acute. Upper glume lanceolate, 1 length of spikelet, membranous, 1-keeled, keeled above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined, obtuse. Fertile lemma oblong, 3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 7–8 mm long overall, with a straight or slightly twisted column or with twisted column. Column of lemma awn glabrous. Palea lanceolate, 1 mm long.

Flower and Fruit. Anthers 2, 2.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast. Guangdong.

Arthraxon meeboldii Stapf. *Kew Bull.* 1908, 449. (1908).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960) (& as *A. meebodii*).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Concan: *Meebold 9132* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Alfred Karl Meebold (1863–1952) German botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms decumbent, weak, 15–20 cm long, 6–8 -noded. Culm-nodes bearded. Leaf-sheaths glabrous on surface or pilose. Ligule a ciliolate membrane. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 2–3.5 cm long, 10–13 mm wide, flaccid. Leaf-blade surface pilose, hairy abaxially, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate.

Inflorescence. Inflorescence composed of racemes. Racemes 2, paired, 3–4.5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 2–2.5 mm long. Rhachis internodes filiform, 4 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, shorter than fertile. Companion sterile spikelet glumes chartaceous, 7 mm long, keeled, 9 -veined. Companion sterile spikelet lemmas 2, enclosed by glumes.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 9.5–10 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled. Lower glume intercarinal veins distinct, 3 in number. Lower glume surface spinose or muricate, rough on flanks. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume primary vein scaberulous. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 4.5 mm long, hyaline, 0 -veined, without midvein, without lateral veins, obtuse. Fertile lemma lanceolate, 6 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 19–22 mm long overall, with twisted column. Column of lemma awn 7–8 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 2.5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Maharashtra.

Arthraxon microphyllus (Trin.) Hochst. *Flora* 39: 188 (1856).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A. sikkimensis*).

TYPE from Nepal. **Basionym or Replaced Name:** *Andropogon microphyllus* Trin., *Mem. Acad. Imp. Sci. St.-Petersbourg, Ser. 6, Sci. Math.* 2(4): 275 (1832). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal.; *Wallich s.n.* (LT: LE).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (811, Fig. 59), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 869).

Derivation (Clifford & Bostock 2007): Gk. *mikros*, small; *phyllon*, leaf. Leaf-blades short.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms rambling, slender, 15–30 cm long. Culm-nodes pubescent. Leaf-sheaths glabrous on surface or pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 0.4–2.5 mm long. Leaf-blade base broadly rounded. Leaf-blades lanceolate or ovate, 0.3–1.7 cm long, 1–4 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate.

Inflorescence. Inflorescence composed of racemes. Peduncle 1.7–9 cm long, glabrous. Racemes 1–3, single or paired or digitate, 2.8–3.9 cm long. Rhachis fragile at the nodes, with scattered hairs or pubescent on surface. Rhachis internodes filiform, 1.2–2.4 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 1.6–1.9 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by single glumes, linear, 1.9–2.2 mm long, shorter than fertile. Companion sterile spikelet glumes 6 -veined, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 2.8–3.9 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base truncate, attached transversely. Spikelet callus hairs 0.2–0.5 mm long.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 6–7 -veined. Lower glume surface scabrous, rough above or on veins. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 1.6–2.1 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 1.7–2.1 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 7–11 mm long overall, with twisted column. Column of lemma awn 3.5–4.5 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.6 mm long. Caryopsis with adherent pericarp.
n = 8 (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent, Indo-China.** Assam, Eastern Himalaya, India, Nepal. Thailand.
Yunnan. Bhutan, Sikkim.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. bare*. Lemmas glabrous.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms rambling, 30–60 cm long, rooting from lower nodes. Culm-nodes pubescent. Lateral branches ample. Leaf-sheaths 2–3 cm long, pilose, outer margin hairy. Ligule a ciliolate membrane, 2 mm long. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 1–8 cm long, 3–20 mm wide. Leaf-blade margins scaberulous, ciliate (sparsely). Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 4–9, borne along a central axis, 1–2.5 cm long. Central inflorescence axis 4–6 cm long. Rhachis fragile at the nodes, glabrous on surface, glabrous on margins. Rhachis internodes linear, 3 mm long, 1 length of fertile spikelet. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1 mm long, glabrous.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, keel-less except near apex, 7 -veined. Lower glume primary vein scaberulous. Lower glume surface convex. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2 mm long, 0.66 length of spikelet, hyaline, 2 -veined, obtuse. Fertile lemma lanceolate, 2.2 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 7 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.5 mm long, yellow. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **Arabian Peninsula, China.** Oman. China South Central. **Indian Subcontinent, Indo-China, Malesia.** Assam. Myanmar, Thailand. Malaya. Yunnan.

Arthraxon okamotoi Ohwi. *Acta Phytotax. & Geobot., Kyoto*, 11: 165 (1942).

Accepted by: T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Taiwan: Kizangun, Takaoshu, *S. Okamoto s.n.* (HT: KYO).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of S. Okamoto, Japanese botanist who collected in Taiwan.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms prostrate, slender, 10–30 cm long. Culm-internodes distally glabrous. Culm-nodes pubescent. Lateral branches ample. Leaf-sheaths 2–4 cm long, mostly shorter than adjacent culm internode, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 1 mm long. Leaf-blade base cordate. Leaf-blades lanceolate or ovate, 1–5 cm long, 5–12 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, exserted or embraced at base by subtending leaf. Racemes 5–8, digitate, 5–7 cm long. Rhachis fragile at the nodes, pilose on surface, ciliate on margins. Rhachis internodes filiform, 3.5–4 mm long. Spikelets in pairs. Fertile spikelets sessile and pedicelled, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 1.5–2 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5–5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, light green, without keels, 11 -veined. Lower glume surface convex, hispidulous, hairy on veins. Lower glume apex dentate, 2 -fid. Upper glume lanceolate, 1 length of spikelet, chartaceous, 1-keeled, keeled above. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined, obtuse. Fertile lemma lanceolate, 3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1–0.2 way up back of lemma, geniculate, 10–12 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 1.5–2 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. **Eastern Asia.** Taiwan.

Derivation (Clifford & Bostock 2007): Gk. *prion*, saw; *-odes*, resembling. Lower glume has stiff hairs on the marginal and submarginal nerves.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial, mat forming. Rhizomes short, knotty, scaly (silky), hairy. Culms rambling, 30–60 cm long, wiry. Ligule an eciliate membrane. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 2–7 cm long, 4–20 mm wide. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–8, digitate, 4–7 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis hairs 1–2 mm long. Rhachis internodes linear, 3–6 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3–6 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets well-developed, lanceolate, 4–5 mm long, shorter than fertile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets linear to lanceolate, laterally compressed, 5–6.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, 2-keeled. Lower glume primary vein pectinately spinose. Lower glume surface convex. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, obtuse. Fertile lemma lanceolate, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 8–15 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 2.5–3.5 mm long.

$n = 8$ (1 ref TROPICOS), or 10, or 18.

Arthraxon pusillus Bor. *J. Ind. Bot. Soc.*, 50A: 92 (1971).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Arabia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Arabia, Jabel Qara: *Vesey-FitzGerald 12364/7* (BM holo, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. very small. Plants of small stature.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, slender, 15–35 cm long. Culm-internodes distally glabrous. Ligule a ciliolate membrane. Leaf-blades lanceolate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–9, digitate, 0.5–2 cm long. Rhachis fragile at the nodes. Rhachis internodes filiform to linear. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, reduced to a stump.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 0.8–1.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels. Lower glume surface convex, scabrous, rough on veins. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma oblong, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 5–6 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.2 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Arabian Peninsula. Oman.

Arthraxon raizadae Jain, Hem. & Desh. *J. Ind. Bot. Soc.* 51:103 (1972).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Mahabeleshwar: Hemadri 98585 (CAL holo, BLAT, BSI, K, L, LE, MH, MO).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Mukat Behari Raizada (1907-) Indian botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 10–50 cm long, rooting from lower nodes. Lateral branches sparse. Leaf-sheaths 1–2 cm long, striately veined, glabrous on surface or pilose, outer margin hairy. Ligule a ciliolate membrane, 1.5 mm long. Leaf-blade base cordate. Leaf-blades lanceolate or ovate, 2–7 cm long, 4–20 mm wide. Leaf-blade surface pilose, sparsely hairy, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle 6–12 cm long. Racemes 1–2, single or paired, 2–5 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear, 3.5–4.5 mm long. Rhachis internode tip not enlarged. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 2.5 mm long, ciliate, hairy all along but hairs longer above.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, dorsally compressed, 5 mm long, shorter than fertile. Companion sterile spikelet glumes chartaceous, 4–5 mm long, keeled, 6–7 -veined. Companion sterile spikelet lemmas 2, enclosed by glumes, 3.5–4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 6–7 mm long, 1–1.3 mm wide, falling entire, deciduous with accessory branch structures. Spikelet callus square, 0.5 mm long, pubescent, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, coriaceous, 2-keeled. Lower glume primary vein scabrous. Lower glume surface pubescent. Lower glume margins ciliate. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume primary vein ciliolate. Upper glume surface pilose, hairy at apex.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3–4 mm long, hyaline, obtuse. Fertile lemma lanceolate, 5 mm long, hyaline, without keel. Lemma apex acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.1 way up back of lemma, geniculate, 15–17.5 mm long overall, with twisted column. Palea absent or minute.

Flower and Fruit. Anthers 3, 2–3 mm long. Caryopsis with adherent pericarp, linear, isodiametric, dark brown.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Maharashtra.

Arthraxon santapau Bor. *Kew Bull.* 1951, 446 (1952).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Purandhar Fort: *Santapau 11450a* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Hermenegild Santapau (1903–1970) Spanish-born Indian cleric and botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms rambling, 15–30 cm long. Culm-nodes pubescent. Leaf-sheaths antrorsely scabrous, glabrous on surface or pilose, with tubercle-based hairs. Ligule a fringe of hairs. Leaf-blade base amplexicaul. Leaf-blades lanceolate, 2–4 cm long, 5–10 mm wide, flaccid. Leaf-blade surface pilose, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle pubescent above. Racemes 2–3, paired or digitate, 3 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform, 3.5 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 3 mm long, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 7.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 7 -veined. Lower glume surface scabrous or spinose, rough above. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume surface scabrous, pilose, hairy above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 0 -veined, without midvein, without lateral veins. Fertile lemma lanceolate, 3 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 18 mm long overall, with twisted column. Column of lemma awn 8 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2, 0.8 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Maharashtra.

Arthraxon submuticus (Nees ex Steud.) Hochst. *Flora* 39: 188 (1856).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Andropogon submuticus* Nees ex Steud., *Syn. Pl. Glumac.* 1: 382 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Nepal; *Arthraxon Wallich Cat. 8836* (HT: ?; ST: BM, CAL, K, W).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sub*, almost; *mutica*, blunt. Apices of glumes or lemmas rounded.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual, mat forming. Culms rambling, 15–100 cm long, rooting from lower nodes. Leaf-sheaths glabrous on surface or hispid. Ligule an eciliate membrane. Leaf-blade base cordate. Leaf-blades lanceolate or ovate, 1.5–4 cm long, 4–15 mm wide. Leaf-blade margins tuberculate-ciliate.

Inflorescence. Inflorescence composed of racemes. Racemes 3–5, digitate, 1–3 cm long. Rhachis fragile at the nodes, angular, glabrous on margins. Rhachis internodes filiform. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, filiform, 0.5–1 mm long, glabrous.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base obtuse, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume elliptic, 1 length of spikelet, chartaceous, without keels, 7 -veined. Lower glume surface convex, scabrous, rough on veins. Lower glume apex acute. Upper glume lanceolate, chartaceous, with hyaline margins, 1-keeled, keeled above, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline, 2 -veined, obtuse. Fertile lemma ovate, hyaline, without keel, 0 -veined, 0–3 -veined, without veins. Lemma apex acute, muticous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1.5 mm long.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. **China.** China South Central. **Indian Subcontinent, Indo-China.** India, Nepal. Myanmar. Yunnan.

Arthraxon typicus (Buse) Koord. *Exkursionsfl. Java*, 1: 110 (1912).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960) (as *A.nitidulus*, *A. breviaristatus*).

TYPE from China. **Basionym or Replaced Name:** *Arthraxon breviaristatus* Hack., DC. Monog. Phan. 6: 350. (1889). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Ki-mi-se: *Delavay 1811* (P syn);.

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (fig. 866).

Derivation (Clifford & Bostock 2007): *L. brevis*, short; *arista*, bristle; -ata, possessing. Glumes or lemmas shortly awned.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms decumbent, 50–100 cm long, rooting from lower nodes. Culm-nodes glabrous or bearded. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane. Leaf-blade base amplexicaul. Leaf-blades lanceolate or ovate, 2–5 cm long, 10–12 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous. Racemes 6–10, digitate, 3–7 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes linear. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, ciliate.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or ovate, laterally compressed, 4.5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus glabrous, base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 7–9 -veined. Lower glume surface convex, spinose, rough on flanks. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, keeled above, 3 -veined. Upper glume primary vein ciliate. Upper glume margins ciliate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 3–3.5 mm long, hyaline. Fertile lemma lanceolate, 4.25–5.25 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 6–8 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Anthers 2 or 3, 3 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China Southeast. **Indian Subcontinent, Indo-China, Malesia.** Assam, India, Nepal. Myanmar, Thailand, Vietnam. Java. Guangdong, Yunnan.

Arthraxon villosus C. E. C. Fischer. *Kew Bull.* 1933, 350 (1933).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: Western Ghats, Bababudans, *Bourne & Bourne s.n.* (HT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Annual. Culms decumbent or rambling, 5–40 cm long. Culm-nodes bearded. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule a ciliate membrane. Leaf-blade base broadly rounded. Leaf-blades ovate, 0.5–3 cm long, 2–8 mm wide. Leaf-blade surface hirsute, densely hairy. Leaf-blade margins ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, 1–4 cm long. Rhachis fragile at the nodes, villous on margins. Rhachis internodes linear, 3 mm long. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear, 2 mm long, villous.

Sterile Spikelets. Companion sterile spikelets well-developed, containing empty lemmas, lanceolate, 4 mm long, shorter than fertile. Companion sterile spikelet glumes keeled, 7 -veined, scabrous. Companion sterile spikelet lemmas 2, enclosed by glumes, muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus base truncate, attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, chartaceous, without keels, 7–9 -veined. Lower glume lateral veins obscure. Lower glume surface convex, scabrous, rough on flanks, villous. Lower glume margins ciliate. Lower glume apex acute. Upper glume lanceolate, chartaceous, 1-keeled, keeled above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 2–2.5 mm long, hyaline. Fertile lemma lanceolate, 3–3.5 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 12–15 mm long overall, with twisted column. Column of lemma awn 5–6 mm long, glabrous. Palea absent or minute.

Flower and Fruit. Anthers 3, 1 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.
Country /Province /State. Indian Subcontinent. India.

Arthraxon xinanensis S.L. Chen & Y.X. Jin. *Bull. Bot. Res. North-East. Forest. Univ.*, 13(2): 105 (1993).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China, Danbar xian: 8th For. Con. Exped. 21315 (JSBI holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Xinan, Sichuan Province, China.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Andropogoninae.

Habit, Vegetative Morphology. Perennial. Culms 30–60 cm long. Culm-internodes distally pilose. Culm-nodes bearded. Leaf-sheaths mostly shorter than adjacent culm internode, pilose, with tubercle-based hairs, outer margin hairy. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blade base cordate. Leaf-blades lanceolate, 3–6 cm long, 5–15 mm wide. Leaf-blade surface glabrous. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, digitate, 3–10 cm long. Rhachis fragile at the nodes, ciliate on margins. Rhachis internodes filiform. Spikelets in pairs. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 1 in the cluster. Pedicels present, linear.

Sterile Spikelets. Companion sterile spikelets well-developed, male, lanceolate, 4 mm long. Companion sterile spikelet glumes 5–7 -veined. Companion sterile spikelet lemmas muticous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–5.5 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus attached transversely.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume lanceolate, 1 length of spikelet, herbaceous, without keels, 7–9 -veined. Lower glume surface convex, spinose or muricate, rough on flanks. Lower glume apex acute. Upper glume lanceolate, membranous, 1-keeled, keeled above. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, 3 mm long, hyaline, 2 -veined, obtuse. Fertile lemma oblong, 4 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex dentate, 2 -fid, acute, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 10–12 mm long overall, with a straight or slightly twisted column or with twisted column. Column of lemma awn glabrous. Palea lanceolate.

Flower and Fruit. Anthers 2, 3.5 mm long, yellow. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central. Gansu, Shaanxi. Guizhou, Sichuan, Yunnan.

Arthropogon filifolius T.S. Filgueiras. *Bradea* 3(21): 151 (1981).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: T.S. Filgueiras 761, 15 Sep 1980, Brazil: Distrito Federal: Cabeça do Veado, capim de espiguetas aristadas, cescendo em brejo recém queimado (IBGE; IT: R, RB, SP, US-2946634).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. filum*, thread; *folium*, leaf. Leaf-blades very narrow.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms slender, 30–60 cm long, 1–1.2 mm diam. Culm-nodes glabrous. Ligule an eciliate membrane, 1 mm long. Leaf-blades filiform, involute, 10–45 cm long, 1 mm wide. Leaf-blade surface ribbed, glabrous or pilose. Leaf-blade apex acute, smooth or hairy.

Inflorescence. Inflorescence a panicle. Panicle open, oblong or ovate, effuse, 5–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, 5–15 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 6–8 mm long, 1.2–2 mm wide, falling entire. Spikelet callus pubescent. Spikelet callus hairs 0.03 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume linear, 3–6 mm long, 0.5–0.75 length of spikelet, coriaceous, much thinner on margins, without keels, 3 -veined. Lower glume apex awned, 1 -awned, awn 3–4 mm long. Upper glume oblong, 1 length of spikelet, coriaceous, without keels, 5 -veined. Upper glume awned, 1 -awned, awn 1.2 mm long.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 5 -veined, scabrous, rough above, obtuse. Fertile lemma linear, 6 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma apex obtuse. Palea 0.5 length of lemma, hyaline, without keels.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 3–4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.
Goiás. Distrito Federal, Goiás. Minas Gerais.

Arthropogon piptostachyus (Griseb.) Pilger. *Rev. Mus. Paulista*, 13: 1250 (1922).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Cuba. **Basionym or Replaced Name:** *Achlaena piptostachya* Griseb., *Cat. Pl. Cub.* 229 (1866). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *C. Wright 3487*, Cuba (NY-71022, US-927103, US-75310 (fragm.)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk *pipto*, fall down; *stachys*, spike as of an ear of wheat. Spikelets deciduous.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms 30–75 cm long. Culm-nodes glabrous. Leaves mostly basal. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades linear or lanceolate, 10–30 cm long, 2–6 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 7–10 cm long, 4–7 cm wide, contracted about primary branches. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6–7 mm long, falling entire. Spikelet callus linear, 2 mm long, pilose. Spikelet callus hairs 0.33 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume subulate, 10–35 mm long. Upper glume oblong, 1 length of spikelet, coriaceous, without keels, 5–7 -veined. Upper glume surface scabrous. Upper glume awned, 1 -awned, awn 10–35 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 5–7 -veined, scabrous, rough above, obtuse. Fertile lemma linear, membranous, without keel, 3 -veined, 0–3 -veined. Lemma apex obtuse. Palea hyaline, without keels.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 2. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Jamaica.

Arthropogon sorengii Gir.-Cañas. *Caldasia* 33(2): 379–380, f. 1–8 (2011).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia: Vaupés: Municipio de Mit? sector Yapobod? sabanas y herbazales de sustratos cuarcíticos y afloramientos rocosos graníticos precámbricos (lajas), ca. 1°22'N - 70°4'O, ca. 480 m, mayo de 2010, *D. Giraldo-Cañas 4560* HT: COL; IT: COAH, COL.

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Rhizomes short, knotty. Butt sheaths thickened and forming a bulb. Culms erect, 30–40 cm long. Culm-nodes brown, glabrous. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths 8.5 cm long. Ligule a ciliolate membrane, 0.2–0.4 mm long, brown. Leaf-blades filiform, involute, 20–38 cm long, 1 mm wide, stiff. Leaf-blade surface ribbed, scaberulous (above) or papillose (below), glabrous. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Peduncle 7–13 cm long. Panicle open, lanceolate, 5–8 cm long, 1.6–2.1 cm wide. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, terete, unequal, 2–22 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, laterally compressed, 4.5–5.5 mm long, falling entire. Spikelet callus pubescent or pilose. Spikelet callus hairs 0.8–1.3(–2.8) mm long.

Glumes. Glumes dissimilar, shorter than spikelet, firmer than fertile lemma. Lower glume linear or lanceolate, 1–3 mm long, 0.2–0.6 length of spikelet, coriaceous, without keels, 3 -veined. Lower glume apex awned, 1 -awned, awn (4–)4.5–5.8(–6.8) mm long. Upper glume linear or lanceolate, 5 mm long, 1 length of spikelet, coriaceous, with scarios margins, without keels, 3 -veined. Upper glume primary vein conspicuous. Upper glume surface scabrous, rough on veins. Upper glume awned, 1 -awned, awn (2–)2.6–6 mm long.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, lanceolate, 4.5–5.5 mm long, 1 length of spikelet, membranous, 3 -veined, scabrous, rough on veins, erose, acute. Palea of lower sterile floret hyaline, 2.8–3 mm long. Fertile lemma lanceolate, 4.5–4.8 mm long, 1.1 mm wide, scarios, without keel, 3 -veined, 0–3 -veined. Palea lanceolate, 3.9–4.1 mm long, 0.9 length of lemma, hyaline, 3 -veined, without keels.

Flower and Fruit. Lodicules 2, 0.2 mm long, fleshy. Anthers 3, 2.5–2.7 mm long, brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Arthropogon villosus Nees. *Fl. Bras. Enum. Pl.* 2(1): 320. 1829.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *K.F.P. von Martius s.n.*, no date, Brazil: in campis altis Chapada de Paranan provinciae Minarum versus Goyaz, et ad Rio Fermoza (M; IT: US-865393 (fragm. ex M)).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (241, Fig. 90), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (107, Fig. 63).

Derivation (Clifford & Bostock 2007): *L. villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths thickened and forming a bulb. Culms geniculately ascending or decumbent, 50–100 cm long. Ligule a fringe of hairs, 1 mm long. Leaf-blades 10–28 cm long, 5–10 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–12 cm long. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, filiform, 2–12 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, laterally compressed, 4–6 mm long, falling entire. Spikelet callus bearded. Spikelet callus hairs 0.3–0.6 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume subulate, 3–7 mm long. Upper glume ovate, 1 length of spikelet, coriaceous, without keels, 3 -veined. Upper glume apex entire or dentate, 2 -fid, awned, 1 -awned, awn 2–4 mm long.

Florets. Basal sterile florets 1, male, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 3 -veined, scabrous, rough above, obtuse. Fertile lemma linear, 3–5

mm long, membranous, without keel, 1 -veined, 0–3 -veined. Lemma apex obtuse. Palea separating from lemma above, 0.66 length of lemma, hyaline, 0 -veined, without keels.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 4 mm long. Embryo 0.5 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast.

Mato Grosso, Goiás, Bahia, Minas Gerais, Rio de Janeiro, Espírito Santo, São Paulo Parana. Distrito Federal, Mato Grosso, Goiás. Bahia. Minas Gerais, São Paulo. Paraná. Oaxaca.

Arthropogon xerachne Ekman. *Ark. Bot.* 10(17): 9, t. 1, f. 4, t. 6, f. 4. 1911.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *xeros*, dry; *achne*, scale. Upper glume coriaceous.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Arthropogoninae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths papery, persistent and investing base of culm, with curly dead sheaths. Culms 30–60 cm long. Culm-nodes constricted, pubescent. Leaves mostly basal. Ligule an eciliate membrane, 1 mm long. Leaf-blades 5–20 cm long, 2–5 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 6–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 17–33 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 7–9 mm long, 2–3 mm wide, falling entire. Spikelet callus bearded. Spikelet callus hairs 0.5–0.66 length of spikelet.

Glumes. Glumes dissimilar, reaching apex of florets, firmer than fertile lemma. Lower glume linear, 10–13 mm long, 0.5–0.75 length of spikelet, coriaceous, without keels, 3 -veined. Lower glume apex awned, 1 -awned, awn 8 mm long. Upper glume oblong, 1 length of spikelet, coriaceous, without keels, 3 -veined. Upper glume apex dentate, 2 -fid, awned, 1 -awned, awn 7–8 mm long.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret similar to upper glume, oblong, 1 length of spikelet, coriaceous, 3 -veined, dentate, 2 -fid, obtuse, awned. Awn of lower sterile floret 3–4 mm long. Fertile lemma linear, membranous, without keel, 1 -veined, 0–3 -veined. Lemma apex obtuse. Palea absent or minute.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Arthrostylidium angustifolium Nash. *Torreyia* 3: 172. (1903).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cuba, El Yunque Mt.: *Underwood & Earle 941* (NY holo,US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *angustus*, narrow; *folium*, leaf. Leaf-blades narrow.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, 200–300 cm long, woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 4–5 mm long, lacerate. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, conduplicate, 15–25 cm long, 2–4 mm wide. Leaf-blade surface scabrous, rough adaxially, glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes borne along a central axis, straight, bilateral, 4–6 cm long, bearing 3 fertile spikelets on each. Central inflorescence axis 20–30 cm long. Spikelet packing lax. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 22–30 mm long, 2–2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2.5–3 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 5–7 mm long, chartaceous, without keel, 9 - veined, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Arthrostylidium auriculatum X. London, Ho & L.G. Clark. *Novon* 8(4): 410 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Amalfi to Porce: *Londono & Clarke 895* (HUA holo, AAU, COL, ISC, JAUM, K, MEDEL, MO, NY, TULV, US).

Illustrations (Journals): *Novon* (8: 411 Fig.1 (1998)).

Derivation (Clifford & Bostock 2007): *L. auris*, ear; *-ula*, diminutive; *-ata*, possessing. Leaf-blades rounded at the base or with auricles.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 200–400 cm long, 2–3 mm diam., woody. Culm-internodes terete, thick-walled, 30–49 cm long, yellow or light green, distally glabrous. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, persistent, 4–8 cm long, pubescent, hairy on margins. Leaves 4–6 per branch. Leaf-sheaths pubescent. Leaf-sheath oral hairs setose, 5–8 mm long, dark. Leaf-sheath auricles erect, 1–2.5 mm long. Ligule a ciliolate membrane, 0.5 mm long, pubescent on abaxial surface. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.5 cm long, petiole glabrous. Leaf-blades lanceolate, 5–16 cm long, 12–25 mm wide. Leaf-blade venation with 14–15 secondary veins. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 15–30 cm long, bearing 17–19 fertile spikelets on each. Rhachis glabrous on surface or puberulous on surface. Spikelet packing broadside to rhachis, distant. Rhachis internodes 3–20 mm long. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the

upper sterile. Spikelets linear, laterally compressed, 13–22 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, 3–5 mm long.

Glumes. Glumes several, 3 empty glumes, persistent, similar, shorter than spikelet. Lower glume elliptic, 4.5–6 mm long, chartaceous, without keels. Lower glume surface puberulous. Lower glume margins ciliate. Lower glume apex acute. Upper glume elliptic, 4.5–6 mm long, without keels. Upper glume surface puberulous. Upper glume margins ciliate. Upper glume apex acute.

Florets. Fertile lemma elliptic, 6–7.5 mm long, 2–2.5 mm wide, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface rugulose, without grooves, puberulous. Lemma margins ciliate. Lemma apex acute, mucronate. Palea 6–6.5 mm long. Apical sterile florets 1 in number, rudimentary.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 5.5 mm long. Embryo 0.15 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Arthrostylidium banoense L.J. Catus Guerra. *Acta Bot. Cubana* 37: 6 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Siera de Banao: *Lune ex Leon 20441* (HAC holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Sierra de Banao, Cuba.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms woody. Culm-internodes terete. Culm-nodes pubescent. Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate, 3 mm long. Ligule a ciliolate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole glabrous or pubescent. Leaf-blades lanceolate, 5–10 cm long, 10–13 mm wide. Leaf-blade surface glabrous. Leaf-blade margins smooth. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 5–10 cm long, bearing few fertile spikelets, bearing 4–7 fertile spikelets on each. Spikelet packing broadside to rachis, distant. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 4–6 mm long, chartaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 4–6 mm long, without keels. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate, 6–7 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute. Apical sterile florets 1 in number, rudimentary.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Arthrostylidium berryi Judz. & Davidse. *Novon* 18(3): 361–365, f. 1–2 (2008).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Amazonas: Laja Suiza, first granite outcrop upstream from mouth of black-water Río Guasacavi on north (right) side, 3.5 km SSW of Santa Cruz (direct air distance), depression next to seasonally flooded shrub savannam 3°4'18N, 67°4'30"W (GPS), 100 m, 3 Mar 1996, *P.E. Berry, G.A. Romero & L. Brako* 5866 (HT: VEN; IT: MO (sheets), TFAV, UWSP).

Illustrations: None found.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose, clumped moderately or densely. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 30–50 mm diam., woody. Culm-internodes terete, thick-walled, smooth or scaberulous, distally glabrous or pubescent. Lateral branches dendroid. Bud complement 1. Branch complement one to two, subtended by a bare patch above the node, thinner than stem. Culm-sheaths present, 3–5 cm long. Culm-sheath blade lanceolate, deciduous, reflexed, 3–4 cm long, 10–13 mm wide. Leaves 11–17 per branch. Leaf-sheaths glabrous on surface or puberulous. Leaf-sheath oral hairs setose, spreading, 4–9 mm long, dark. Ligule an eciliate membrane, 0.5–1 mm long, brown. Collar with external ligule. Leaf-blade base truncate or broadly rounded, symmetrical or asymmetrical, with a brief petiole-like connection to sheath, petiole 0.15–0.5 cm long. Leaf-blades reflexed, lanceolate, 11–16 cm long, 10–16 mm wide. Leaf-blade surface scaberulous, rough adaxially, puberulous, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle 4–10 cm long. Racemes 1, single, bilateral, 15–30 cm long, bearing 12–20 fertile spikelets on each. Rhachis puberulous on surface, scabrous on margins. Spikelet packing broadside to rhachis, distant. Spikelets solitary. Fertile spikelets sessile or sessile and pedicelled. Pedicels absent or present, 1–2 mm long.

Fertile Spikelets. Spikelets comprising 9–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–80(–100) mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma or similar to fertile lemma in texture. Lower glume lanceolate, 4–6 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, keeled above, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 6–8 mm long, 0.66 length of adjacent fertile lemma, membranous, 1-keeled, keeled above, 7–9 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 9–11.5 mm long, 1.3–2 mm wide, membranous or coriaceous, keeled, (9–)11–13(–15) -veined, more than 3-veined. Lemma apex acute. Palea 8–11 mm long, 1–1.1 length of lemma, 4 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America and Western South America. Venezuela. Colombia.

Arthrostyidium canaliculatum Renvoize. *Gr. Boliv.* :33 (1988).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolivia, Franz Tamayo: *Beck & Foster 18476* (LPB holotype).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (34, Fig. 3).

Derivation (Clifford & Bostock 2007): *L. canalis*, channel; *-ula*, diminutive; *-ata*, possessing. Leaf-blades deeply channelled.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms slender, 600 cm long, 4–5 mm diam., woody. Culm-internodes terete, thin-walled, 100 cm long. Lateral branches dendroid. Branch complement many, in a clump, subtended by a bare patch above the node. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 5.5–9 cm long, 12–20 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate or attenuate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 8–12 cm long. Spikelet packing broadside to rhachis, lax, 2 -rowed. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper

sterile. Spikelets linear, subterete, 15–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5 mm long, 0.7–0.8 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume surface pubescent. Lower glume apex acute. Upper glume lanceolate, 6–7 mm long, 0.5 length of adjacent fertile lemma, chartaceous, without keels, 7 -veined. Upper glume surface pubescent. Upper glume apex acute.

Florets. Fertile lemma elliptic, 11–12 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acute. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Arthrostylidium chiribiquetense X. London, Ho & L.G. Clark. *Novon* 8(4): 412 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Sierra de Chiribiquete: *Palacios et al.* 2681 (COL holo, COAH, FFMB, MA, US).

Illustrations (Journals): *Novon* (8: 413 Fig.2 (1998)).

Derivation (Clifford & Bostock 2007): *L. ense*, denoting origin. From Sierra de Chiribiqueta, Colombia.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 300–500 cm long, 3–6 mm diam., woody. Culm-internodes terete, thin-walled (pith filled), 28–52 cm long, distally hispid, with reflexed hairs. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, persistent, 3.5–5 cm long, 3 times as long as wide, glabrous or puberulous, ciliate on shoulders, shoulders with curved hairs, shoulders with 2 mm long hairs. Culm-sheath ligule 0.2 mm high. Culm-sheath blade ovate, demarcated but persistent, erect, 1–4 cm long, 9–20 mm wide, glabrous on surface and with ciliate margins. Leaves 9–14 per branch. Leaf-sheaths 2.5–4 cm long, mostly shorter than adjacent culm internode or subequal to internodes, striately veined, glabrous on surface. Leaf-sheath oral hairs setose, curly, 5–10 mm long, dark. Ligule a ciliolate membrane, 0.8–1 mm long, pubescent on abaxial surface. Collar with external ligule. Leaf-blade base truncate, with a brief petiole-like connection to sheath, petiole 0.2–0.5 cm long. Leaf-blades ovate, 6–18.5 cm long, 20–50 mm wide. Leaf-blade midrib indistinct. Leaf-blade venation with distinct cross veins. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 8–17 cm long, bearing 10–18 fertile spikelets on each. Rhachis glabrous on surface or pilose on surface. Spikelet packing broadside to rhachis, lax. Rhachis internodes 5–10 mm long. Spikelets spreading, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 5–17 mm long, 0.6–0.8 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 6.5–7 mm long.

Glumes. Glumes two or several, comprising 0–2 gemmiferous bracts, 1–2 empty glumes, persistent, similar, shorter than spikelet. Lower glume ovate, 3–4 mm long, chartaceous, without keels, 5–7 -veined. Lower glume lateral veins prominent. Lower glume surface pubescent. Lower glume margins ciliolate. Lower glume apex acute. Upper glume ovate, 4.3–5.5 mm long, without keels, 5–7 -veined. Upper glume primary vein conspicuous. Upper glume surface pubescent. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma oblong, 5.5–8.5 mm long, 2–2.5 mm wide, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface rugulose, without grooves, pubescent. Lemma margins

ciliolate, hairy above. Lemma apex acute, mucronate. Palea 6.5–8.1 mm long. Palea apex ciliate. Apical sterile florets 1 in number, rudimentary.

Flower and Fruit. Lodicules 3, 1.5 mm long, veined, ciliate. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Arthrostylidium cubense Rupr. *Mem. Acad. Petersb. Ser. VI. v. 118. t. 4. f. 13.* (1839).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Cuba, Havana: *Ramon de la Sagra* (LE holo, US).

Illustrations (Books): E.J.Judziewicz et al, *American Bamboos* (1999) (156, Fig. 68).

Illustrations (Journals): *Smithsonian Contributions to Botany* (9: 18, Fig. 6 (1973)).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Cuba.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiata. Bud complement 1. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 10–15 cm long, 8–10 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 7–20 cm long. Spikelet packing distant. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 1.5–3 mm long, chartaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 3–4 mm long, chartaceous, without keels. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate, 6 mm long, chartaceous, acuminate. Fertile lemma lanceolate, 7 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 1 mm long overall. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Western South America. Cuba.

Arthrostylidium distichum Pilger. *Urb. Symb. Antill. 2: 342* (1901).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Cuba, Rangel: *Wright 3808* (NY iso, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *Gk. distichos*, two-rowed. Plants with conspicuously two-rowed spikelets or leaves.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, woody. Culm-internodes terete, thick-walled, smooth,

distally pubescent. Culm-nodes pubescent. Lateral branches dendroid. Branch complement one to three, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaves distichous. Leaf-sheaths 1 cm long, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, 5–15 mm long. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 1.5–3 cm long, 4–6 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 10–20 cm long, bearing 8–15 fertile spikelets on each. Rhachis glabrous on surface. Spikelet packing distant. Spikelets deflexed, clustered at each node. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 10 mm long, chartaceous, without keel, 3–5 -veined, 0–3 -veined or more than 3-veined. Lemma margins ciliolate, hairy above. Lemma apex obtuse, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba, Haiti.

Arthrostylidium ecuadorensis E.J. Judziewicz & L.G. Clark. *Syst. Bot.* 18(1): 82 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ecuador, Guagra: *Holm-Nielsen et al.* 27444 (AAU holo).

Illustrations (Journals): *Systematic Botany* (18: 83, Fig.1 (1993)).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Ecuador.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 300–600 cm long, 1–2.5 mm diam., woody. Culm-internodes terete, solid, purple, retrorsely scabrous, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement three or several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present. Leaves 3–7 per branch. Leaf-sheaths striately veined, puberulous. Leaf-sheath oral hairs setose, curly, 3–6 mm long, dark. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.25 cm long, petiole glabrous or pubescent. Leaf-blades lanceolate, 3.8–10 cm long, 8–13 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous (below). Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, flexuous or sinuous, bilateral, 5–9 cm long, bearing 3–6 fertile spikelets on each. Rhachis semiterete. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–40 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes eventually visible between lemmas.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 3–4.5 mm long, 0.75–9 length of upper glume, chartaceous, without keels, 1–3 -veined. Lower glume primary vein scabrous. Lower glume lateral veins absent or obscure. Lower glume surface glabrous or puberulous. Lower glume apex acute. Upper glume ovate, 3.5–6 mm long, 0.5 length of adjacent fertile lemma, without keels, 3–5 -veined. Upper glume primary vein scabrous. Upper glume surface glabrous or puberulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6–13 mm long, chartaceous, red or purple, without keel, 7–9 -veined, more than 3-veined. Lemma surface glabrous or puberulous. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea keels ciliolate. Palea surface pubescent, hairy on back. Palea apex emarginate to obtuse. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 2.7–3 mm long, veined. Anthers 3, linear, 4.5–6 mm long, purple. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Colombia, Ecuador.

Arthrostylidium ekmanii Hitchcock. *U. S. Dept. Agric, Misc. Publ. No. 243* : 16 (1936).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Haiti. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman H7982*, 10 Apr 1927, Haiti: Hispaniola I. (US-1410884).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Erik Leonard Eckman (1888–1931) Swedish botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, drooping at the tip, 2 mm diam., woody. Culm-internodes terete, thick-walled, 25 cm long, retrorsely scabrous, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs setose, 5–7 mm long. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1 cm long. Leaf-blades deciduous at the ligule, lanceolate, 3–6 cm long, 4–8 mm wide. Leaf-blade surface glabrous. Leaf-blade apex hairy.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 0–5 cm long, bearing 1–3 fertile spikelets on each. Spikelet packing lax. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes zig-zag, eventually visible between lemmas, glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 3–7 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, 4–8 mm long. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, 5–9 mm long. Fertile lemma lanceolate or ovate, widest at 0.33 of its length from base, 9–12 mm long, 1.5 mm wide, chartaceous, light brown, without keel, more than 3-veined. Lemma apex obtuse, mucronate. Palea bowed outwards, 1 length of lemma. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Dominican Republic, Haiti.

Arthrostylidium excelsum Griseb. *Fl. Brit. W. Ind.* 529. (1864).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Dominica. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Dominica: *Imray* (US syn); Trinidad: *Crueger* (K syn); Trinidad, Las Cuevas hills: *Tocuche*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. tall. Culms high climbing.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning, 100–500 cm long, 2–3 mm diam., woody. Culm-internodes terete, distally glabrous. Lateral branches dendroid. Branch complement two to several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs setose, 9–17 mm long. Ligule a ciliolate membrane, 0.1–0.2 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–16 cm long, 14–38 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, sinuous (distally), bilateral, 9–16 cm long. Spikelet packing broadside to rhachis, distant. Spikelets appressed or ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–11 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–34 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3–4 mm long, eventually visible between lemmas, glabrous.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 4.5–6 mm long, 0.8–0.9 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume apex acute. Upper glume elliptic, 5.3–6.9 mm long, 0.66–0.75 length of adjacent fertile lemma, without keels, 7 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 8–9.5 mm long, chartaceous, without keel, 9–11 -veined, more than 3-veined. Lemma surface glabrous or puberulous. Lemma apex obtuse. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 4.5–5 mm long. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Southeast Mexico. Mesoamerica, Caribbean. Guatemala, Honduras, Nicaragua, Panama. Leeward Is, Trinidad-Tobago.

Chiapas.

Arthrostyloidium farctum (Aublet) T. Soderstrom & A. Lourteig. *Phytologia* 64(2): 163 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);.

Derivation (Clifford & Bostock 2007): L. solid with centre softer than outside. Culms solid except in the very centre.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, pendulous at the tip, 400–1500 cm long, 1–3 mm diam., woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, filiform, involute, 2–30 cm long, 0.5–3 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 0–7 cm long, bearing 1–4 fertile spikelets on each. Spikelet packing distant. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 3 mm long, chartaceous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 4 mm long. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 5 mm long, chartaceous, without keel, 7–9 - veined, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Northern South America. Bahamas, Cuba, Dominican Republic, Haiti, Leeward Is, Puerto Rico. French Guiana.

Arthrostylidium fimbriatum Griseb. *Mem. Am. Acad. N. S.* 8: 531. (1863).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Arthrostylidium fimbrinodum E.J. Judziewicz & L.G. Clark. *Syst. Bot.* 18(1): 84 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Rio Urubu: *Calderon, Monteiro & Guedes 2894* (INPA holo, F, MO, US, WIS).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. fimbriae*, fringe; nodum, knot. Nodes bearing a skirt of reflexed hairs.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 700 cm long, 4–12 mm diam., woody. Culm-internodes terete, thick-walled, smooth or scaberulous. Culm-nodes bearded. Lateral branches dendroid, extravaginal. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, 9–13 cm long, setose on shoulders, shoulders with 10 mm long hairs. Culm-sheath blade linear, deciduous, erect, 6–7 cm long. Leaves 9–21 per branch. Leaf-sheaths keeled, glabrous on surface or puberulous, outer margin hairy. Leaf-sheath oral hairs setose, 3–6 mm long, dark. Ligule a ciliolate membrane, 0.2–0.3 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.07–0.1 cm long. Leaf-blades lanceolate, 2.5–11 cm long, 3–18 mm wide. Leaf-blade midrib indistinct. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 2.5–3.5 cm long, bearing few fertile spikelets, bearing 2–5 fertile spikelets on each. Rhachis glabrous on surface. Spikelet packing broadside to rhachis, lax. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 3–3.3 mm long, chartaceous, without keels, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acuminate. Upper glume lanceolate, 4.2–4.8 mm long, 1-keeled, keeled above, 5–7 -veined. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma lanceolate, 5.3–6.5 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea surface puberulous, hairy on back. Apical sterile florets 1 in number, rudimentary.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Colombia. Brazil North.

Amazonas, Pará, Rondonia.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *N.A. Rosa & M.R. Santos 1897*, 11 May 1977, Brazil: Par? Missão Curur? floresta de igap? parcialmente alagado, planta semi-escadente do sub-bosque, inflorescencia em botões (INPA; IT: MO-2816380, NY (2 sheets), US-2901733).

Illustrations (Journals): *Systematic Botany* (18: 86, Fig.3 (1993)).

Derivation (Clifford & Bostock 2007): *L. grandis*, large; *folium*, leaf. Leaf-blades large.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 12 mm diam., woody. Culm-internodes terete, thick-walled, 50 cm long, smooth, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement several,

in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present. Leaves 7 per branch. Leaf-sheaths 7–8 cm long, mostly shorter than adjacent culm internode, striately veined, papillose, glabrous on surface. Leaf-sheath oral hairs lacking. Leaf-sheath auricles erect, 5 mm long. Ligule a ciliolate membrane, 6–10 mm long, brown. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 1 cm long, petiole glabrous. Leaf-blades ovate, 20–26 cm long, 50–70 mm wide. Leaf-blade surface papillose, rough adaxially, glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight or arcuate, bilateral, 25–40 cm long, bearing 15–25 fertile spikelets on each. Rhachis glabrous on surface. Spikelet packing broadside to rhachis. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 17–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1–1.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5.5–7 mm long, chartaceous, 1-keeled, keeled above, 3 -veined. Lower glume lateral veins without connecting veins or with cross-veins. Lower glume apex acuminate. Upper glume lanceolate, 7–8.5 mm long, 1-keeled, keeled above, 5 -veined. Upper glume lateral veins without cross-veins or with cross-veins. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 10–11.5 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma lateral veins without cross-veins or with cross-veins. Lemma apex acute.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Colombia. Brazil North.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Haiti.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, 200–300 cm long, woody. Culm-internodes terete, thick-walled, antrorsely scabrous, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty, deciduous. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2 cm long, petiole pubescent. Leaf-blades deciduous at the ligule, lanceolate, 4–7 cm long, 3–6 mm wide. Leaf-blade surface glabrous. Leaf-blade margins smooth or scaberulous. Leaf-blade apex obtuse, hairy.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 5 cm long, bearing 4–8 fertile spikelets on each. Spikelet packing distant. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes clavate, 3 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 6–6.5 mm long, chartaceous, without keels, 7 -veined. Lower glume apex obtuse. Upper glume lanceolate, 6–6.5 mm long, 7 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 7–8 mm long, chartaceous, without keel, 7 -

veined, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Dominican Republic, Haiti.

Arthrostylidium judziewiczii G. Davidse. *Novon* 2(2): 81 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Costa Rica, Volcan Barva: *Grayum 7024* (MO holo, BM, CANB, CR, F, ISC, K, PMA, SI, SP, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Emmet J. Judziewicz (1953-) United States botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 200–400 cm long, 1–2 mm diam., woody. Culm-internodes terete, thick-walled. Culm-nodes glabrous. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, deciduous, pubescent, hairy at the base, without auricles, setose on shoulders, shoulders with 4–9.5 mm long hairs. Culm-sheath blade lanceolate, constricted at base, deciduous, reflexed, 2–2.5 cm long, 3–4 mm wide. Leaves 1–6 per branch. Leaf-sheaths keeled, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, 4–9.5 mm long. Ligule an eciliate membrane, 0.3–1.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.16–0.3 cm long, petiole glabrous. Leaf-blades lanceolate, 6–13 cm long, 10–20 mm wide. Leaf-blade midrib indistinct. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, bracteate at pedicel base (in distal part of raceme). Peduncle glabrous. Racemes 1, single, bilateral, 8–14 cm long, bearing few fertile spikelets, bearing 4–6 fertile spikelets on each. Rhachis 1 mm wide, glabrous on surface. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 35–65 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, 4–7 mm long, pubescent, hairy above. Floret callus pilose. Floret callus hairs 1–1.5 mm long.

Glumes. Glumes one the lower absent or obscure, persistent, shorter than spikelet. Upper glume ovate, asymmetrical, 5.5–6.5 mm long, 0.5–0.66 length of adjacent fertile lemma, 1-keeled or 2-keeled, 6 -veined. Upper glume margins eciliate or ciliolate. Upper glume apex acute, mucronate or awned, 1 -awned, awn 0.2–1.8 mm long.

Florets. Basal sterile florets 1, barren, with palea or without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, ovate, 9 -veined, with conspicuous midvein, with cross-veins, acute, mucronate or awned. Awn of lower sterile floret 0.5–1.3 mm long. Palea of lower sterile floret 0–0.5 length of lemma. Fertile lemma lanceolate, 8–11.5 mm long, chartaceous, keeled, 9 -veined, more than 3-veined. Lemma margins scaberulous. Lemma apex acute, mucronate or awned, 1 -awned. Principal lemma awn 0.5–2 mm long overall. Palea 1 length of lemma, 2 -veined. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 3–3.5 mm long, membranous, veined, ciliate. Anthers 3, 3.8–5.1 mm long. Stigmas 2. Ovary pubescent on apex. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica, Panama.

Arthrostylidium longiflorum Munro. *Trans. Linn. Soc.* 26: 41 (1868).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Venezuela, Colonia Tovar: *Moritz 1685* (BM lecto).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. longus*, long; *flos*, flower. Having long spikelets.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 300–400 cm long, 20 mm diam., woody. Culm-internodes terete, thin-walled, smooth, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, 15 cm long. Culm-sheath blade lanceolate, erect, 30 cm long, acuminate. Leaves 5–7 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs setose, flat, spreading, 8–12 mm long, dark. Ligule a ciliolate membrane, 0.3 mm long, pubescent on abaxial surface. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.5 cm long, petiole glabrous. Leaf-blades ovate, 18–23 cm long, 35–50 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, flexuous, bilateral, 10–15 cm long, bearing 6–12 fertile spikelets on each. Rhachis semiterete, glabrous on surface. Spikelet packing broadside to rhachis. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 10–14 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes obscured by lemmas.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 4–6 mm long, 0.7–0.8 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 5–8 mm long, 0.5 length of adjacent fertile lemma, without keels, 5–7 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 13–16 mm long, chartaceous, without keel, 1–3 -veined, 0–3 -veined or more than 3-veined, one-veined or several-veined. Lemma lateral veins obscure. Lemma apex acuminate. Palea 11–13 mm long. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 3–4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Arthrostylidium merostachyoides R.W. Pohl. *Novon*, 2(2): 83 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *R. W. Pohl & L. G. Clark 14613*, 4 Jan 1985, Costa Rica: Puntarenas: Monteverde forest Reserve. Cloud forest, edge of cliff, Pantanoso trail. 1600 m, Colony all in bloom, Canes 5–10 m x 1–1.5 cm, arching (ISC; IT: CR-147551, F, K, MO, US-3178730).

Illustrations (Journals): *Novon* (2: 85, Fig. 1 (1992)).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Resembling *Merostachys*.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms arching, 500–1000 cm long, 10–15 mm diam., woody. Culm-internodes terete, thick-walled, yellow, distally glabrous. Lateral branches dendroid. Branch complement many, in a clump, subtended by a bare patch above the node. Culm-sheaths present, persistent, glabrous, without auricles. Culm-sheath ligule 0.5 mm high, ciliolate. Culm-sheath blade lanceolate, demarcated but persistent or deciduous, acuminate. Leaves 4–7 per branch. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, 7–16 mm long. Ligule a ciliolate membrane, 0.5–0.6 mm long. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.15–0.25 cm long, petiole pubescent.

Leaf-blades drooping, deciduous at the ligule, lanceolate or oblong, 4–17 cm long, 10–26 mm wide. Leaf-blade surface glabrous. Leaf-blade margins pubescent, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, secund, 2.5–8 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets pectinate, in pairs. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets obovate, laterally compressed, 9.5–14 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet. Lower glume oblong, 0.1–2.5 mm long, chartaceous, without keels, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume ovate, 2–3.5 mm long, 0.33–0.66 length of adjacent fertile lemma, 3–5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, with palea or without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, ovate, 3.5–5 mm long, 3–7 -veined, acute. Fertile lemma lanceolate or ovate, 6.2–8.2 mm long, chartaceous, keeled, 5–7 -veined, more than 3-veined. Lemma apex acute. Palea 1 length of lemma, 2 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, membranous, veined, glabrous. Anthers 3, 3.2–4.2 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica.

Arthrostylidium multispicatum Pilger. *Urb. Symb. Antill.* 2: 341 (1901).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Puerto Rico. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Puerto Rico, Maricao: *Sintenis 209* (US iso).

Illustrations (Books): A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (17, Fig. 1).

Derivation (Clifford & Bostock 2007): *L. multus*, many; *spica*, thorn; *-ata*, possessing. Inflorescence with many racemes.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, pendulous at the tip, woody. Culm-internodes terete, thick-walled, retrorsely scabrous, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface or puberulous. Leaf-sheath oral hairs ciliate, deciduous. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 6–8 cm long, 10–12(–30) mm wide. Leaf-blade venation with 7 secondary veins. Leaf-blade surface puberulous, hairy abaxially. Leaf-blade margins smooth.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 6–8 cm long, bearing 3–5 fertile spikelets on each. Spikelet packing lax. Rhachis internodes 10–15 mm long. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3.5 mm long, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex obtuse. Upper glume lanceolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate, 7 mm long, chartaceous, without keel, more than 3-veined. Lemma apex obtuse, pubescent, mucronate. Palea 1 length of lemma. Palea keels scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 3 mm long. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Southern South America. Cuba, Dominican Republic, Haiti, Puerto Rico. Uruguay.

TYPE from Martinique. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Martinique, Morne d'Amour: *Duss 1310* (NY syn); Martinique, Morne d'Amour: *Duss 563* (NY syn, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. obtusus*, blunt; *-ata*, possessing. Lemmas truncate.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiata. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs setose, 8–10 mm long. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 4–8 cm long, 6–12 mm wide, stiff. Leaf-blade venation indistinct, without cross veins. Leaf-blade surface glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 4–6 cm long, bearing 5–7 fertile spikelets on each. Spikelet packing lax. Rhachis internodes 10–12 mm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 12–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes straight or zig-zag.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 8–9 mm long, chartaceous, without keel, more than 3-veined. Lemma lateral veins prominent. Lemma margins ciliate, hairy above. Lemma apex obtuse, mucronate. Palea 1 length of lemma. Palea keels ciliate. Palea apex ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long. Anthers 3, 4 mm long. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Windward Islands.

Arthrostylidium pinifolium L.J.Catasus Guerra. *Acta Bot. Cubana*, 4: 4 (1980).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Trinidad. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Trinidad: Coll? (LE holo, K).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (61, Fig. 15), E.J.Judziewicz et al, *American Bamboos* (1999).

Derivation (Clifford & Bostock 2007): *L. pubesco*, become hairy. Plant whole or in part hairy.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or geniculately ascending, 1000–1500 cm long, 10–20 mm diam., woody. Culm-internodes terete, thick-walled, distally hispid. Lateral branches dendroid. Bud complement 1. Branch complement many, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, hispid, without auricles. Culm-sheath ligule 2 mm high. Culm-sheath blade lanceolate, 10–23 cm long, hispid, acute. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs woolly, dark. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 6–20 cm long, 4–15 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 3–14 cm long. Rhachis semiterete. Spikelet packing broadside to rhachis, distant. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–40 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes eventually visible between lemmas.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 3–4 mm long, 0.7–0.8 length of upper glume, chartaceous, without keels, 3–5 -veined. Lower glume apex acute. Upper glume elliptic, 4–5 mm long, 0.5 length of adjacent fertile lemma, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma ovate, 8–9 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma apex acute. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Caribbean, Northern South America, Western South America. Costa Rica. Trinidad-Tobago. Venezuela. Colombia.

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Corregimiento de Virolin: *Diaz-Piedrahita 3399* (COL holo).

Illustrations (Books): E.J.Judziewicz et al, *American Bamboos* (1999) (157, Fig. 69).

Illustrations (Journals): *Novon* (8: 416 Fig.3 (1998)).

Derivation (Clifford & Bostock 2007): *L. punctum*, small hole; *-ulus*, diminutive; *-ata*, possessing.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 400–700 cm long, 5–10 mm diam., woody. Culm-internodes terete, thin-walled, 18–51 cm long. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with subequal branches, thinner than stem. Culm-sheaths present, persistent, 7.5–15 cm long, 2.5–3 times as long as wide, green and purple, distinctly mottled with last colour, glabrous. Culm-sheath ligule 0.5 mm high. Culm-sheath blade triangular, demarcated but persistent, erect, 5–11 cm long, 18–32 mm wide, pubescent and with ciliate margins. Leaves 4–6(–9) per branch. Leaf-sheaths striately veined, papillose, glabrous on surface, outer margin glabrous or hairy. Leaf-sheath oral hairs setose, curly, 6–10 mm long, pale. Ligule a ciliolate membrane, 0.8–1 mm long, pubescent on abaxial surface. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.4–0.7 cm long, petiole pubescent. Leaf-blades ovate, 10–22 cm long, 20–40 mm wide. Leaf-blade midrib indistinct. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous or pilose, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 10–15 cm long, bearing few fertile spikelets, bearing 4–8 fertile spikelets on each. Rhachis pilose on surface. Spikelet packing broadside to rhachis. Rhachis internodes 6–26 mm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–50 mm long, 3–6 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3–5 mm long, pilose.

Glumes. Glumes two or several, 2–3 empty glumes, persistent, similar, shorter than spikelet. Lower glume ovate, 3.5–5.5 mm long, chartaceous, without keels. Lower glume primary vein scabrous. Lower glume surface glabrous. Lower glume margins ciliate. Lower glume apex acute. Upper glume ovate, 6.5–8 mm long, without keels, 7–9 -veined. Upper glume surface glabrous. Upper glume margins ciliate. Upper glume apex acute, mucronate.

Florets. Fertile lemma ovate, 9–10.5 mm long, 4–5 mm wide, chartaceous, without keel, 7–10 -veined, more than 3-veined. Lemma surface rugulose, without grooves, glabrous. Lemma margins ciliate. Lemma apex acute, mucronate. Palea 8–9.5 mm long, 3 -veined. Palea keels ciliate. Apical sterile florets 1 in number, rudimentary.

Flower and Fruit. Lodicules 3, 2–4 mm long, veined, ciliate. Anthers 3, 2–2.5 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Arthrostyloidium reflexum Hitchcock & Ekman. U. S. Dept. Agric, Misc. Publ. No. 243 : 19 (1936).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E.L. Ekman 18020*, 10 Nov 1923, Cuba: Pinar del Río (US-1502075; IT: US-1538630).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. bent sharply backwards. Spikelets bent in the middle.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches dendroid. Branch complement one to three, solitary or in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths reticulately veined, glabrous on surface. Leaf-sheath oral hairs setose, 40–50 mm long. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades ascending, deciduous at the ligule, lanceolate, conduplicate or involute, 5–15 cm long, 7–10 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes borne along a central axis, straight, bilateral, 0.5 cm long. Central inflorescence axis 10–20 cm long, glabrous. Spikelet packing lax. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, curved, subterete, 6–7 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 0.5 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, 1 mm long. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 4–5 mm long, chartaceous, without keel, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Arthrostylidium sarmentosum Pilger. *Urb. Symb. Antill.* 4: 108 (1903).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Puerto Rico. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Puerto Rico, Luquillo Mts.: *Heller & Heller 1089* (US lecto, B, NY).

Illustrations (Books): A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (18, Fig. 2).

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);.

Derivation (Clifford & Bostock 2007): *L. sarmentum*, small branch; *-osa*, abundance. Culms much branched.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, pendulous at the tip, 2–3 mm diam., woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 3.5–5 cm long, 3–5 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, sinuous, bilateral, 2–4 cm long, bearing 2–5 fertile spikelets on each. Spikelet packing lax. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 5 mm long, chartaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma apex acute, mucronate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Northern South America, Western South America. Cuba, Dominican Republic, Haiti, Puerto Rico, Trinidad-Tobago. Venezuela. Colombia.

Arthrostylidium scandens McClure. *Mem. N. Y. Bot. Gard.* 10, No. 5, 4 (1964).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Cerro Huachamacari: Maguire, Cowan & Wurdack 29957 (US holo, NY).

Illustrations (Books): E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (73, Fig. 9).

Illustrations (Journals): *Systematic Botany* (18: 91, Fig.5 (1993)).

Derivation (Clifford & Bostock 2007): *L. scando*, climb up. Of scrambling habit.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms arching or leaning or scandent, slender, 500–800 cm long, 5–9 mm diam., woody, rooting from lower nodes. Culm-internodes terete, thick-walled, smooth, distally glabrous. Culm-nodes brown or purple. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement two or three, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present, deciduous, distinctly mottled with last colour, glabrous on margins or hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule 0.2–0.3 mm high, ciliolate. Culm-sheath blade lanceolate, deciduous, 7–11 cm long. Leaves 5–9 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking or setose, 6–10 mm long, pale or dark. Leaf-sheath auricles erect. Ligule an eciliate membrane, 3–5 mm long, membranous, brown. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.4–0.6 cm long, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 10–23 cm long, 15–45 mm wide. Leaf-blade midrib indistinct. Leaf-blade surface glabrous or puberulous, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 10–25 cm long, bearing 7–12 fertile spikelets on each. Rhachis glabrous on surface. Spikelet packing broadside to rhachis, lax. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1–3 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 28–40 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, clavate, 4–7 mm long, eventually visible between lemmas.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 4–5 mm long, chartaceous, without keels, 1–5 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 6–7 mm long, 1-keeled, keeled above, 5–7 -veined. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate or ovate, 9–11 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Guyana, Surinam, Venezuela.

Arthrostylidium schomburgkii (Benn.) Munro. *Trans. Linn. Soc.* 26: 41 (1868).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Arundinaria schomburgkii* Benn. *Trans. Linn. Soc. London* 18(4): 562 (1841). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *Schomburgk s.n.*, Venezuela ST: *Humboldt & Bonpland s.n.*.

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (37, Fig. 19).

Illustrations (Journals): *Systematic Botany* (18: 94, Fig.6 (1993)).

Derivation (Clifford & Bostock 2007): in honor of Robert Hermann Schomburgk (1808–1865) German botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning, 1000–1500 cm long, 15–35 mm diam., woody. Culm-internodes unequal, the lower longer, terete, thin-walled, 300–500 cm long (lowest) or 35–45 cm long, light green, smooth, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present. Leaves 4–7 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs scanty, 5–15 mm long. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.3 cm long. Leaf-blades lanceolate, 17–23 cm long, 9–12 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle 10–15 cm long. Racemes 1, single, bilateral, 15–25 cm long, bearing 5–8 fertile spikelets on each. Rhachis semiterete, glabrous on surface. Spikelet packing broadside to rhachis, distant. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–70 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated between glumes. Rhachilla elongation 2.5–3 mm long. Rhachilla internodes 3–5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 6–16 mm long, 0.6–1 length of upper glume, chartaceous, without keels, 1–5 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acute. Upper glume lanceolate, 10–16 mm long, 0.75 length of adjacent fertile lemma, without keels, 3–5 -veined. Upper glume apex acute, awned, 1 -awned, awn 2–4 mm long.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret present, similar to fertile lemma. Fertile lemma elliptic or ovate, 13–18 mm long, 3–4 mm wide, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma lateral veins prominent. Lemma apex acute, awned, 1 -awned. Principal lemma awn 4–7 mm long overall. Palea elliptic, 8–9 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 3–4 mm long, glabrous. Anthers 3, 6.5 mm long, yellow. Filaments 0.5 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Guyana, Venezuela.

Arthrostyloidium simpliciusculum (Pilger) McClure. *Smithsonian Contrib. Bot.* 9: 20 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria simpliciuscula* Pilg., *Bot. Jahrb. Syst.* 56 (Beibl. 123): 29 (1920). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E. Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. simplicior*, simpler; *-ula*, diminutive.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning, slender, 1000–1200 cm long, woody. Culm-internodes terete, thick-walled. Lateral branches dendroid. Branch complement many, in a clump, subtended by a bare patch above the node. Ligule a ciliolate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.15 cm long. Leaf-blades deciduous at the ligule, lanceolate, 5–10 cm long, 5–11 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 7–12 cm long, bearing few fertile spikelets, bearing 4–7 fertile spikelets on each. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 45–60 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 5–6 mm long, 0.66 length of upper glume, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, 8–9 mm long, 0.9 length of adjacent fertile lemma, chartaceous, without keels. Upper glume apex acute.

Florets. Fertile lemma elliptic, 9–11 mm long, chartaceous, without keel, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 1.5–3 mm long overall. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Colombia, Ecuador, Peru. Brazil West Central, Brazil North. Amazonas.

Arthrostylidium urbanii Pilger. *Urb. Symb. Antill.* 2: 339 (1901).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cuba: *Wright 3810* (US iso).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Ignatz Urban (1848–1931) German botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, slender, 500–700 cm long, woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches fastigiate. Branch complement many, in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths mostly shorter than adjacent culm internode, puberulous. Leaf-sheath oral hairs scanty, curly or deciduous, 3–5 mm long, pale. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole pubescent. Leaf-blades spreading or reflexed, deciduous at the ligule, linear or lanceolate, 5–13 cm long, 3–5 mm wide, stiff. Leaf-blade surface puberulous, hairy abaxially or on both sides. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes 1, single, straight, bilateral, 5–15 cm long, bearing 10–15 fertile spikelets on each. Rhachis puberulous on surface. Spikelet packing contiguous. Rhachis internodes 2–3 mm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume surface puberulous. Lower glume apex obtuse. Upper glume lanceolate, 1.5–2 mm long, 1.5–2 length of adjacent fertile lemma. Upper glume surface puberulous. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, elliptic, 2.5 mm long, puberulous, obtuse. Fertile lemma lanceolate or ovate, 4.5–5 mm long, chartaceous, without keel, 5–7 -veined, more than 3-veined. Lemma lateral veins prominent. Lemma surface puberulous. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea keels ciliolate, adorned above. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Arthrostylidium venezuelae (Steud.) McClure. *Journ. Wash. Acad. Sci.* 2: 172 (1942).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Chusquea venezuelae* Steud., *Syn. Pl. Glumac.* 1: 337 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *N. Funck & L.J. Schlim (J. Linden)* 494, Apr 1846, Venezuela: Federal District: Caracas, at Galipan, alt. 5000 ft. (G; IT: BM, BR, P, US-2874669 (fragm.), US-1647875 (fragm.), W).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): from Venezuela.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms rambling or scandent, slender, 300–800 cm long, 10–30 mm diam., woody. Culm-internodes terete, thick-walled or solid, scaberulous, distally glabrous or pubescent, with reflexed hairs. Culm-nodes pubescent. Lateral branches dendroid. Bud complement 1. Branch complement in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, glabrous, without auricles. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, 5–9 mm long, dark. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.35 cm long, petiole pubescent. Leaf-blades deciduous at the ligule, ovate, 5–14 cm long, 10–15 mm wide, dark green. Leaf-blade surface pilose, sparsely hairy, hairy abaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, flexuous, bilateral, 5–8 cm long. Rhachis semiterete. Spikelet packing broadside to rhachis, distant. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 10–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, clavate, 4.5–7 mm long, eventually visible between lemmas, sparsely hairy, hairy at tip.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume elliptic, 3–4 mm long, 0.7–0.8 length of upper glume, chartaceous, without keels, 4 -veined. Lower glume apex acute. Upper glume elliptic, 4–5 mm long, 0.66 length of adjacent fertile lemma, without keels, 7 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma ovate, 6–7.5 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex obtuse. Palea 1 length of lemma. Palea keels ciliolate, adorned above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 3.2–3.5 mm long, yellow. Stigmas 2. Ovary umbonate. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** North America, South America.

Country /Province /State. **Mexico.** Southeast Mexico. **Mesoamerica, Caribbean, Northern South America, Western South America.** Costa Rica, Nicaragua, Panama. Guyana, Venezuela. Bolivia, Colombia.

Arthrostylidium virolinense X. London, Ho & L.G. Clark. *Novon* 8(4): 417 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Corregimiento Virolin: *Diaz-Piedrahita* 4048 (COL holo).

Illustrations (Journals): *Novon* (8: 418 Fig.4 (1998)).

Derivation (Clifford & Bostock 2007): *L. ense*, denoting origin. From Corregimineto Virolin, Colombia.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 200–300 cm long, 1–3 mm diam., woody. Culm-internodes terete, solid, 7–21 cm long, papillose, distally glabrous. Lateral branches dendroid, intravaginal. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant or 2 branches dominant, thinner than stem. Culm-sheaths present, persistent, 2–4 cm long, 4 times as long as wide, hispid, ciliate on shoulders, shoulders with curved hairs, shoulders with 1 mm long hairs. Culm-sheath ligule 0.2 mm high, ciliolate. Culm-sheath blade lanceolate, demarcated but persistent, erect, 0.9–2.1 cm long, 1–2 mm wide, hispid. Leaves 8–12 per branch. Leaf-sheaths striately veined, hispid, outer margin hairy. Leaf-sheath oral hairs setose, curly, 3–5 mm long. Ligule a ciliolate membrane, 0.1–0.2 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.08–0.1 cm long, petiole pubescent. Leaf-blades lanceolate, 1–4.5 cm long, 2–4.5 mm wide, mid-green and light green, discolorous with last colour beneath. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bilateral, 3–4 cm long, bearing few fertile spikelets, bearing 1–4 fertile spikelets on each. Rhachis pilose on surface. Spikelet packing broadside to rhachis. Rhachis internodes 5–7 mm long. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 10–16 mm long, 1.5–4 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–2 mm long, pilose.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 1.5–2.5 mm long, chartaceous, without keels, 3 -veined. Lower glume surface hispid. Lower glume apex obtuse. Upper glume ovate, 2.5–3 mm long, without keels, 5 -veined. Upper glume surface hispid. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 4–4.5 mm long, 2–2.5 mm wide, chartaceous, purple, without keel, 5–6 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface rugulose, without grooves, glabrous or hispidulous. Lemma margins ciliolate, hairy above. Lemma hairs 4–4.5 mm long. Lemma apex acute. Palea keels eciliate. Palea apex pubescent. Apical sterile florets 1 in number, lanceolate.

Flower and Fruit. Lodicules 3, 1–1.5 mm long, veinless. Anthers 3, 2.5–3 mm long, pallid or yellow. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Arthrostyloidium youngianum L.G. Clark & E.J. Judziewicz. *Syst. Bot.* 18(1): 98 (1993).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Ecuador, Maldonado: *Young 137* (US holo, AAU, MO, QCA, US).

Illustrations (Journals): *Systematic Botany* (18: 97, Fig.7 (1993)).

Derivation (Clifford & Bostock 2007): in honor of Stephen M. Young (fl. 1980), collector of bamboos in Ecuador.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 1200 cm long, 5–15 mm diam., woody. Culm-internodes terete, smooth, distally glabrous. Culm-nodes swollen (corky). Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, tardily deciduous, 11–26 cm long, asymmetrical at apex, ciliate on shoulders. Culm-sheath blade lanceolate, 6–12 cm long, 10–20 mm wide. Leaves 3–5 per branch. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, 3–5 mm long, dark. Ligule a ciliolate membrane, 0.1–0.2 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.4 cm long. Leaf-blades lanceolate, 9–15 cm long, 13–28 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight, bilateral, 4–10 cm long, bearing few fertile spikelets, bearing 4–8 fertile spikelets on each. Rhachis 1 mm wide, glabrous on surface. Spikelet packing broadside to rhachis, lax. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 13–28 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 3.3–6.5 mm long, chartaceous, without keels, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 4–8.5 mm long, without keels, 3–7 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate, 7.5–10.5 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 2 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Western South America.** Colombia, Ecuador.

Arundinaria albosericea (W.T. Lin) N.H. Xia. *J. Trop. and Subtrop. Botany* 17 (4): 353 (2009).

TYPE from China. **Basionym or Replaced Name:** *Pleioblastus albosericeus* W.T. Lin, *J. S. China Agric. Univ.* 11(3): 47 (1990). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Guangdong: Fogang, Guanyinshan, *J.Y. Lin 27937*, HT: CANT

Illustrations: None found.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Butt sheaths absent. Culms 100–300 cm long, 6–10 mm diam., woody. Culm-internodes terete, thin-walled, 16–30 cm long, distally glabrous. Culm-nodes swollen. Lateral branches dendroid. Branch complement three. Culm-sheaths present, deciduous but leaving a persistent girdle, glabrous or hispid, without auricles, glabrous on shoulders. Culm-sheath ligule 1.5 mm high. Culm-sheath blade lanceolate, erect or reflexed. Leaves 4–5 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane, 1 mm long, truncate. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 8–20 cm long, 19–20 mm wide. Leaf-blade venation with 10–14 secondary veins. Flowering specimens unknown.

Distribution (TDWG). **Continent.** Temperate Asia.

Country /Province /State. **China.** China Southeast. Guangdong.

Arundinaria appalachiana Triplett, Weakley & L.G. Clark. *Sida* 22(1): 88, f. 1–5 (200).

Country /Province /State. **Southeastern USA.** Georgia, North Carolina, South Carolina, Tennessee.

Arundinaria baviensis Balansa. Morot, *Journ. de Bot.* 4: 27. (1890).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online.

TYPE from Vietnam. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Viet Nam: Croit dans la region superieure du Mont-Bavi, *Balansa 1585* (IT: K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Mount Bavi, Indo-China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 400–500 cm long, woody. Culm-internodes terete, thin-walled, distally glabrous. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 6–10 cm long, 7–10 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface puberulous, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or oblong, laterally compressed, 30 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5 mm long, pubescent. Floret callus disarticulating obliquely.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate or ovate, 6 mm long, chartaceous, without keels. Lower glume margins ciliate. Lower glume apex acute. Upper glume lanceolate or ovate, 8.5–9 mm long, chartaceous, without keels, 9 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 9–9.5 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Palea 10 mm long. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Vietnam.

Arundinaria caudiceps Koidz. *Acta Phytotax. & Geobot., Kyoto*, 6: 216. (1937).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Japan,. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Hikamigun: Ohda.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. caudex*, stem; *-ceps*, relating to the head. Leaves retained in clumps on the upper nodes of the culms.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 100–200 cm long, woody. Culm-internodes terete, thin-walled, distally pubescent. Culm-nodes pubescent. Lateral branches suffrutescent. Branch complement two, as thick as stem. Culm-sheaths present, persistent, pilose. Leaf-sheaths puberulous. Leaf-sheath oral hairs ciliate, spreading. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or oblong, 12–17 cm long, 25–31 mm wide, fleshy. Leaf-blade surface glabrous. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria debilis Thw. *Enum. Pl. Zeyl.* 375 (1864).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sri Lanka. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Sri Lanka, Central Province: Coll?.

Illustrations: None found.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (*Smith. Contr. Bot.* No. 72 : 7 (1988)).

Derivation (Clifford & Bostock 2007): *L. weak*. Culms decumbent often much branched at the base.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 300–450 cm long, 5–10 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement three, in a horizontal line, subtended by a bare patch above the node, with 1 branch dominant, thinner than stem. Culm-sheaths present, deciduous, yellow or green or purple, pubescent, without auricles. Culm-sheath ligule ciliolate. Culm-sheath blade lanceolate, deciduous, reflexed, 3–4 cm long, pubescent (at base). Leaves 7–10 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Leaf-blades linear or lanceolate, 4–8 cm long, 3–6 mm wide, light green or glaucous, discolorous with last colour beneath. Leaf-blade midrib prominent beneath. Leaf-blade venation without cross veins. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 4–6 cm long, 2–3 cm wide. Primary panicle branches ascending or spreading. Panicle branches glabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–5 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, 4–6 mm long, glabrous or sparsely hairy, hairy at tip.

Glumes. Glumes deciduous, similar, shorter than spikelet. Lower glume ovate, 4–5.5 mm long, chartaceous, without keels, 7 -veined. Lower glume apex acute. Upper glume ovate, 5.4–6.8 mm long, chartaceous, without keels, 7 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 7–10.2 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long, ciliate. Anthers 3, 5 mm long, yellow. Stigmas 2. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Sri Lanka.

Arundinaria densifolia Munro. *Trans. Linn. Soc.* 26: 32 (1868).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sri Lanka. **Basionym or Replaced Name:** *Sinarundiaria densifolia* (Munro) C.S.Chao & S.A.Renouze, *Kew Bull.*, 44(2): 354 (1989). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Watson* 25, Sri Lanka (K). LT designated by Soderstrom & Ellis, *Smithsonian Contr. Bot.* 72: 12 (1988).

Illustrations: None found.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (*Smith. Contr. Bot.* No. 72 : 11 (1988)).

Derivation (Clifford & Bostock 2007): *L. densus*, dense; *folium*, leaf. Leaves densely imbricate.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–250 cm long, 5–10 mm diam., woody. Culm-internodes terete, thin-walled, purple. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement many, in a clump, with subequal branches, thinner than stem. Culm-sheaths present, yellow, glabrous, without auricles. Culm-sheath ligule 0.5 mm high, ciliolate. Culm-sheath blade triangular, erect. Leaves 5–10 per branch. Leaf-sheaths puberulous. Ligule a ciliolate membrane, pubescent on abaxial surface. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.05–0.1 cm long, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 3–4 cm long, 3.5–5 mm wide, stiff, dark green, concolorous. Leaf-blade midrib prominent beneath. Leaf-blade venation with obscure cross veins or with distinct cross veins. Leaf-blade margins cartilaginous, scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, comprising 3–15 fertile spikelets. Panicle open, lanceolate, 2–3.5 cm long, 1 cm wide, bearing few spikelets. Primary panicle branches indistinct the panicle almost racemose or simple or sparsely divided. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, laterally compressed, 10 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 4.5–6 mm long, chartaceous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex attenuate, awned, 1 -awned, awn 2–3 mm long. Upper glume ovate, 6–7 mm long, chartaceous, without keels, 7 -veined. Upper glume primary vein scabrous. Upper glume apex attenuate, awned, 1 -awned, awn 2–3 mm long.

Florets. Fertile lemma lanceolate, 8–10 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 2–3 mm long overall. Palea 7.5–8.5 mm long. Palea keels contiguous above a sulcus, scabrous. Palea apex scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long, veined, ciliate. Anthers 3, 4–5 mm long, yellow. Stigmas 2. Caryopsis with adherent pericarp, apex unappendaged. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India, Sri Lanka.
Kerala.

Arundinaria fargesii E.G.Camus. *Lecomte, Not. Syst.* ii. 244 (1912).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. **Basionym or Replaced Name:** *Bashania fargesii* (E. G. Camus) P.C. Keng & Yi, *J. Bamboo Res.*, 1(2): 37 (1982). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.P. Farges s.n.*, 4 May 1892, China: Sichuan (P; IT: E, K, US-2808859, US-1506705, US-1506703).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 147).

Derivation (Clifford & Bostock 2007): In honor of Paul Guillaume Farges (1844–1912) French cleric and amateur botanist who collected in China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms woody. Culm-internodes terete, solid. Culm-nodes pubescent. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths puberulous. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 7–12 cm long, 10–15 mm wide. Leaf-blade surface glabrous or puberulous, hairy abaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, comprising 15 fertile spikelets. Panicle open, 6–10 cm long, bearing few spikelets. Panicle axis puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 15 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 4–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes clavate, pubescent, hairy all along but hairs longer above.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 5–7 mm long, chartaceous, without keels. Lower glume apex acuminate. Upper glume ovate, 7–8 mm long, chartaceous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 7–9 mm long, chartaceous, dark brown, without keel, more than 3-veined. Lemma surface glabrous, inner surface pilose. Lemma margins ciliolate. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 1–3 mm long overall. Palea 1 length of lemma. Palea apex emarginate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, glabrous or ciliate. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China North-Central.
Gansu, Shaanxi. Hubei, Sichuan.

Arundinaria floribunda Thw. *Enum. Pl. Zeyl.* 375 (1864).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sri Lanka. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Sri Lanka, Maturatte: Coll?.

Illustrations: None found.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (*Smith. Contr. Bot.* No. 72 : 17 (1988)).

Derivation (Clifford & Bostock 2007): *L. floreo*, bloom; *-bunda*, indicating action. Inflorescence of many flowers.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 10–25 mm diam., woody. Culm-internodes terete, thin-walled, light green or purple, mottled, scaberulous. Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, thinner than stem. Culm-sheaths present, deciduous, green or purple, pilose, with purple hairs, without auricles. Culm-sheath ligule 0.5 mm high, ciliolate. Culm-sheath blade lanceolate, narrower than sheath, deciduous, spreading or reflexed, 3 cm long, 2–3 mm wide, acuminate. Leaves 6–10 per branch. Leaf-sheath oral hairs setose. Ligule absent. Leaf-blades lanceolate, 9–18 cm long, 10–17 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade venation without cross veins. Leaf-blade margins unthickened, smooth or scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 15–20 cm long, 8–10 cm wide. Panicle branches glabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 7–8 mm long.

Fertile Spikelets. Spikelets comprising 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–35 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 3.8–5.6 mm long, chartaceous, without keels, 5 -veined. Lower glume margins ciliolate. Lower glume apex acute. Upper glume ovate, 5.5–6.1 mm long, chartaceous, without keels, 7 -veined. Upper glume margins ciliolate. Upper glume apex acute.

Florets. Fertile lemma ovate, 8.5–10 mm long, chartaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex apiculate. Palea keels contiguous above a sulcus, winged. Palea surface scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.5–2 mm long, veined, ciliate. Anthers 3, 4.3–6 mm long, orange. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Sri Lanka.

Arundinaria gigantea (Walt.) Muhl. *Cat. Pl. Amer. Sept.* 14 (1813).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Arundo gigantea* Walter, *Fl. Carol.* 81 (1788). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: USA: [South Carolina],.

Recent Synonyms: *Arundinaria tecta* (Walter) Muhl.

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 24 *Poaceae*, part 1 (2007) (19 & 20 as *Arundinaria tecta*), F.W.Gould, *The Grasses of Texas* (1975) (41, Fig. 6), E.J.Judziewicz et al, *American Bamboos* (1999) (197, Fig. 98), D.Farrelly, *The Book of Bamboo* (1984) (as *Arundinaria tecta* & *A. tecta* var. *decidua*).

Illustrations (Journals): *Smithsonian Contributions to Botany* (9: 27, Fig. 7, 29; Fig. 8, 31; Fig. 9; 33; Fig. 10; 35; Fig. 11, 37; Fig. 12; 39, Fig. 13; 41, Fig. 14; 43, Fig. 15; 45, Fig. 16 (1973)).

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);.

Derivation (Clifford & Bostock 2007): *L.* very large. Culms tall compared with those of related species.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph, with peripheral air canals. Butt sheaths absent. Culms erect, 200–500(–800) cm long, woody. Culm-internodes similar in length, terete, thin-walled. Culm-nodes glabrous or pubescent. Lateral branches dendroid. Branch complement three or several, with subequal branches, thinner than stem. Culm-sheaths present, deciduous, without auricles. Leaf-sheath oral hairs setose. Leaf-sheath auricles falcate. Ligule an eciliate membrane, 0.5–1 mm long. Collar pubescent. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 15–25 cm long, 20–40 mm wide. Leaf-blade venation with distinct cross veins.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 6–12 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 40–70 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent.

Glumes. Glumes one the lower absent or obscure or two or several, 1–2 empty glumes, persistent, similar, shorter than spikelet. Lower glume lanceolate, 0.3–0.7 length of upper glume, chartaceous, without keels, 5–7 -veined. Lower glume apex acute. Upper glume elliptic, 0.5 length of adjacent fertile lemma, chartaceous, without keels, 7–9 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 15–25 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface puberulous, hairy below. Lemma apex attenuate, muticous or mucronate or awned, 1 -awned. Principal lemma awn 0–5 mm long overall. Palea 1 length of lemma, 2 -veined. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Europe (*), North America.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **North-central USA, Northeast USA, South-central USA, Southeastern USA.** Oklahoma. Ohio, West Virginia. Texas. Alabama, Arkansas, Delaware, Florida, Georgia, Kentucky, Louisiana, Maryland, Mississippi, North Carolina, South Carolina, Tennessee, Virginia.

Arundinaria graminea (Bean) Makino. *Bot. Mag., Tokyo*, 26: 18 (1912).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Pleioblastus*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. **Basionym or Replaced Name:** *Pleioblastus gramineus* (Bean) Nakai, *Journ. Arnold Arb.* 6: 146 (1925), *Arundinaria hindsii* var. *graminea* Bean, *Gard. Chron.* 3(15): 238 (1894). T:<Type of Basionym>; *vide* TROPICOS and Kew Synonymy Database: India,.

Illustrations (Books): C-C Hsu, *Taiwan Grasses* (1975) (714, Pl. 1484).

Derivation (Clifford & Bostock 2007): *L. gramen*, grain. In some respect resembling a cereal.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 300–500 cm long, 5–20 mm diam., woody. Culm-internodes terete, thin-walled, 10–25 cm long, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid. Branch complement two or three. Culm-sheaths present, deciduous, coriaceous, glabrous, without auricles. Culm-sheath blade linear. Leaves 5–11 per branch. Leaf-sheaths 2.5–4 cm long, glabrous on surface. Leaf-sheath oral hairs scanty or setose, 4–6 mm long, pale. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long. Leaf-blades deciduous at the ligule, linear or lanceolate, 10–30 cm long, 5–17 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the

upper sterile. Spikelets linear, laterally compressed, 25–45 mm long, 5–8 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 4–5 mm long, pubescent.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 16–20 mm long, chartaceous, without keels, 7 -veined. Lower glume apex acute. Upper glume lanceolate, chartaceous, without keels, 11 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 13–15 mm long, chartaceous, without keel, 11–13 -veined, more than 3-veined. Lemma apex acuminate. Palea 10–12 mm long, 8 -veined. Palea keels ciliate. Palea apex with excurrent keel veins. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ovate, veined, ciliate. Anthers 3, 7 mm long. Stigmas 3. Caryopsis with adherent pericarp, fusiform, 7–8 mm long, dark brown, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia, Australasia.

Country /Province /State. China and Eastern Asia. Japan. New Zealand. New Zealand North I.

Arundinaria humilis Mitford. *Bamboo Garden*, 103 (1896).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Pleioblastus*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Pleioblastus*).

TYPE from UK, cultivated. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: cult. England,.

Recent Synonyms: *Pleioblastus pumilus* (Mitford) Nakai, *Journ. Jap. Bot.* 11: 2 (1935).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. low growing. Short-statured in comparison with related species often prostrate.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 100–200 cm long, 4–7 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Culm-nodes glabrous or pubescent. Lateral branches lacking or sparse. Culm-sheaths present, glabrous. Leaf-sheaths pilose. Leaf-sheath oral hairs setose, pale. Ligule an eciliate membrane or a ciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 15–25 cm long, 15–25 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, hairy adaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, bearing few fertile spikelets, bearing 2–4 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 40–60 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5–6 mm long, eventually visible between lemmas.

Glumes. Glumes two, persistent, shorter than spikelet. Lower glume linear, 6–7 mm long. Lower glume apex attenuate. Upper glume lanceolate, 9–12 mm long, chartaceous, without keels. Upper glume apex attenuate.

Florets. Fertile lemma elliptic, 12–15 mm long, chartaceous, without keel, 11–13 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex acuminate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Europe (*), Temperate Asia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). Caucasus, Eastern Asia. Transcaucasus. Japan.

Arundinaria kodzumae (Makino) J.P. Demoly. *Bambou*, 21: 14 (1995).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Masayuki Kodzuma.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 200–300 cm long, 10–15 mm diam., woody. Culm-internodes terete, thin-walled, yellow or light green, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid. Branch complement three, thinner than stem. Culm-sheaths present, glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 18–24 cm long, 20–28 mm wide, indurate. Leaf-blade surface glabrous. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria kongosanensis Makino. *Journ. Jap. Bot.* 5: 10 (1928).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan.,

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ensis*, denoting origin. From Kongo-san, a mountain in Osaka Prefecture, Japan.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 100–200 cm long, 5–8 mm diam., woody. Culm-internodes terete, thin-walled, distally pubescent. Culm-nodes pubescent or bearded. Lateral branches lacking or sparse. Culm-sheaths present, puberulous, with reflexed hairs. Leaf-sheaths puberulous, with simple hairs or reflexed hairs. Leaf-sheath oral hairs setose, erect. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 15–20 cm long, 18–30 mm wide. Leaf-blade surface puberulous, densely hairy, hairy abaxially or on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes one the lower absent or obscure, persistent, shorter than spikelet. Upper glume lanceolate, chartaceous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 13–15 mm long, chartaceous, without keel, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex acuminate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria linearis Hack. *Bull. Herb. Boiss.* 7: 721 (1899).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *J. Matsumura* 377, no date, Japan: (IT: US-02808847). OS.

Illustrations (Books): C-C Hsu, *Taiwan Grasses* (1975) (716, Pl. 1485).

Derivation (Clifford & Bostock 2007): *L. linea*, linen thread; *-are*, pertaining to. Leaf blades narrow.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 50–400 cm long, 5–20 mm diam., woody. Culm-internodes terete, thin-walled, 10–30 cm long, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid. Branch complement one to several. Culm-sheaths present, antrorsely scabrous, pilose, without auricles. Culm-

sheath blade linear. Leaves 5–9 per branch. Leaf-sheaths 3–5 cm long, glabrous on surface. Leaf-sheath oral hairs scanty, 6–8 mm long, pale. Ligule an eciliate membrane or a ciliolate membrane, 1.5–4 mm long, truncate. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2 cm long. Leaf-blades deciduous at the ligule, linear or lanceolate, 6–28 cm long, 5–10 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence comprising only a few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 7–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 50–100 mm long, 3–4 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 11 mm long, chartaceous, without keels, 3 -veined. Lower glume apex acute. Upper glume lanceolate, chartaceous, without keels, 7 -veined. Upper glume lateral veins with cross-veins. Upper glume apex acute.

Florets. Fertile lemma ovate, 9–22 mm long, 4–8 mm wide, chartaceous, without keel, 13 -veined, more than 3-veined. Lemma apex acuminate. Palea 7–15 mm long, 11 -veined. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ovate, 3–4 mm long, veined, ciliate. Anthers 3, 8 mm long. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China and Eastern Asia. Japan, Nansei-Shoto, Taiwan.

Arundinaria matsunoi Makino. *Journ. Jap. Bot.* 2: 8 (1918).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hab. Prov. Musashi: Yokohama, *T. Makino*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Jutara Matsumo (1868–1946) Japanese botanist.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 200–300 cm long, woody. Culm-internodes terete, thin-walled, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid. Branch complement three, thinner than stem. Culm-sheaths present, glabrous, without auricles. Leaf-sheaths pilose. Leaf-sheath oral hairs setose, pale. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 20–27 cm long, 15–25 mm wide, indurate. Leaf-blade surface glabrous. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria munsuensis Y.N. Lee. *Korean J. Pl. Taxon.*, 28(1): 33 (1998).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: nom. inval., the words type or holotype not cited (Art. 37.4).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Munsu, South Korea.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 50–60 cm long, 1.5–3 mm diam., woody. Culm-internodes terete, thin-walled, 15 cm long. Lateral branches suffrutescent. Culm-sheaths present. Leaf-sheaths 5–6 cm long, outer margin hairy. Leaf-sheath oral hairs ciliate, erect. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 8 cm long, 12 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 30 mm long, 5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, chartaceous. Upper glume elliptic, chartaceous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 22 mm long, chartaceous, without keel, 11 -veined, more than 3-veined. Lemma apex setaceously acuminate. Palea 19 mm long. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 4.5–5 mm long, ciliate. Anthers 3, 5 mm long. Stigmas 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Korea.

Arundinaria nagashima (Mitf.) Asch. & Graebn. *Syn. Mitteleur. Fl.* 2,1:772 (1902).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Bambusa nagashima* Marliac ex Mitford, *Bamb. Gard.* 46: 547 (1894).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): From Nagashima Island, Japan.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms 100–200 cm long, 3–5 mm diam., woody. Culm-internodes terete, thin-walled, distally pubescent, with reflexed hairs. Culm-nodes bearded. Lateral branches dendroid. Culm-sheaths present, puberulous, with reflexed hairs, without auricles. Leaf-sheaths puberulous. Leaf-sheath oral hairs setose, erect. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 14–18 cm long, 20–25 mm wide. Leaf-blade surface glabrous or puberulous, densely hairy, hairy adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 6–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 45–50 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two, persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume lanceolate, 12 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, chartaceous, without keels. Upper glume apex acute.

Florets. Fertile lemma ovate, 12–15 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma apex acuminate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria pygmaea (Miq.) Makino. *Bot. Mag. Tokyo* 13:319 (1899).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Pleioblastus fortunei* (v. Houtte) Nakai, *Journ. Jap. Bot.* 9: 232 (1933).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. dwarf. Culms shorter than those of many other species in the genus.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 20–40 cm long, 1–2 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Culm-nodes glabrous or pubescent. Lateral branches suffrutescent. Culm-sheaths present, glabrous. Leaves distichous. Leaf-sheaths glabrous on surface or puberulous. Leaf-sheath oral hairs setose, pale. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 3–7 cm long, 3–10 mm wide. Leaf-blade surface glabrous or puberulous, sparsely hairy, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–60 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 5–7 mm long, eventually visible between lemmas.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 8–10 mm long, chartaceous, without keels. Lower glume apex acute. Upper glume lanceolate, 8–10 mm long, chartaceous, without keels. Upper glume apex acute.

Florets. Fertile lemma ovate, 13–16 mm long, chartaceous, without keel, 5–7 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex acuminate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Europe (*), Temperate Asia, Tropical Asia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **China, Eastern Asia.** China Southeast. Japan. **Indian Subcontinent.** Assam, India.

Sikkim. Assam. Orissa, Uttah Pradesh.

Arundinaria qingchengshanensis (P.C.Keng & Yi) D.Z.Li. *Novon* 15: 600 (2005).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Basionym or Replaced Name: *Bashania aristata* Y. Ren, Yun Li & G.D. Dang, *Novon* 13(4): 473–475, pl. 1 (2003) .

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 146).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Quin Cheng Shan, Sichuan Province, China.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Butt sheaths absent. Culms 200–400 cm long, 3–10 mm diam., woody. Culm-internodes terete, solid, 40–45 cm long, dark green, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid. Culm-sheaths present, green or purple, hispid, hairy on margins, without auricles, setose on shoulders, shoulders with 3–4 mm long hairs. Culm-sheath ligule 0.5–1 mm high, purple. Culm-sheath blade lanceolate or triangular. Leaves 1–3 per branch. Leaf-sheaths puberulous. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles erect. Ligule an eciliate membrane, 1 mm long, truncate. Leaf-blade base cuneate, with a brief petiole-like connection to sheath, petiole 0.3–0.4 cm long, petiole glabrous. Leaf-blades lanceolate, 22–32 cm long, 24–34 mm wide. Leaf-blade venation with 12–16 secondary veins. Leaf-blade surface scabrous, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, 6–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–12 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 5–14 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 5–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes clavate, 3–5 mm long, pubescent.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, chartaceous, without keels. Lower glume surface pilose. Lower glume apex acuminate, mucronate. Upper glume ovate, chartaceous, without keels. Upper glume surface pilose. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma ovate, 7–8 mm long, chartaceous, without keel, more than 3-veined. Lemma surface pilose, inner surface pilose. Lemma margins ciliolate. Lemma apex acuminate, mucronate. Palea 8–9 -veined. Palea surface pilose, hairy on margins. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ovate, ciliate. Anthers 3, purple. Stigmas 2. Caryopsis with adherent pericarp, ellipsoid, 7–8 mm long, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Sichuan.

Country /Province /State. China. China Southeast. Guangdong.

Arundinaria scandens T.R. Soderstrom & R.P. Ellis. *Smithsonian Contrib. Bot.*, 72: 20 (1988).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sri Lanka. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Sri Lanka, Pidurutalagala: *Beddome* (PDA holo).

Illustrations: None found.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (*Smith. Contr. Bot.* No. 72 : 22 (1988)).

Derivation (Clifford & Bostock 2007): *L. scando*, climb up. Of scrambling habit.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 700–800 cm long, 10–15 mm diam., woody. Culm-internodes terete, thick-walled, distally hirsute. Lateral branches dendroid. Bud complement 1. Branch complement several, in a clump, thinner than stem. Culm-sheaths present, persistent, brown or purple, pilose, with appressed hairs, without auricles. Culm-sheath ligule 1.7 mm high, dentate. Culm-sheath blade lanceolate, deciduous, spreading, 10–12 cm long, 2.5 mm wide, scabrid, acute. Leaves 0 per branch (not in complements). Ligule an eciliate membrane, 0.5 mm long, erose. Leaf-blade base broadly rounded, with a brief petiole-like connection to sheath, petiole 0.05 cm long. Leaf-blades oblong, 6–9 cm long, 16–23 mm wide, mid-green or mid-green or glaucous, concolorous or discolorous with last colour beneath. Leaf-blade midrib prominent beneath. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade margins smooth. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 6–7 cm long, 6 cm wide. Primary panicle branches ascending or spreading. Panicle branches stiff, glabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3–5 mm long, pubescent, hairy above.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume ovate, 2.7–3.6 mm long, chartaceous, without keels, 5 -veined. Lower glume lateral veins with cross-veins. Lower glume apex acute. Upper glume ovate, 3.9–4.5 mm long, chartaceous, without keels, 5 -veined. Upper glume lateral veins with cross-veins. Upper glume inner surface pubescent. Upper glume apex acute.

Florets. Fertile lemma ovate, 6.3–7.5 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma inner surface pubescent. Lemma apex acute. Palea 7 -veined. Palea keels winged. Palea surface puberulous, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.6–1.7 mm long, ciliate. Anthers 3, 5 mm long. Stigmas 2. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.
Country /Province /State. Indian Subcontinent. Sri Lanka.

Arundinaria shiobarensis Nakai. *Journ. Jap. Bot.* 10: 579 (1934).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Japan. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Japan: Hondo: Shimotsuke prov., secus vias Shinyu, Shiobara, *F. Maekawa* (HT: TI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Shiobara, Tochigi Prefecture, Japan.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 100–200 cm long, 4–8 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Culm-nodes glabrous. Lateral branches suffrutescent. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present, persistent, glabrous. Leaf-sheaths pilose. Leaf-sheath oral hairs ciliate, spreading. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 17–19 cm long, 25–31 mm wide. Leaf-blade surface pubescent, hairy abaxially or on both sides. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Eastern Asia. Japan.

Arundinaria simonii (Carr.) A. & C. Riviere. *Bull. Soc. Acclim. Ser.* 3, 5: 774 (1878).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Pleioblastus*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Pleioblastus*).

TYPE from China. **Basionym or Replaced Name:** *Bambusa simonii* Carrière, *Rev. Hort.* 37: 380 (1866)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: ??: 1862, *E. Simon s.n.* (HT: P).

Illustrations (Books): C-C Hsu, *Taiwan Grasses* (1975) (718, Pl. 1486), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrata Catarinensis Gramineas* (1981–1982) (109, Fig. 24), D.Farrelly, *The Book of Bamboo* (1984) (163).

Derivation (Clifford & Bostock 2007): in honor of Eughne L. Simon (1838–1924) French diplomat who sent plants to the Simon-Louis brothers' nursery at Metz in Alsace, France.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect or arching, 600–800 cm long, 20 mm diam., woody. Culm-internodes terete, thin-walled, 40–45 cm long, distally glabrous. Lateral branches dendroid. Branch complement three or several, with subequal branches, thinner than stem. Culm-sheaths present, persistent, glabrous, hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule 3–4 mm high. Culm-sheath blade linear or lanceolate, reflexed, glabrous on surface. Leaf-sheaths 25 cm long, striately veined, glabrous on surface. Leaf-sheath oral hairs scanty, pale. Ligule an eciliate membrane or a ciliate membrane, 3–4 mm long, truncate or obtuse. Leaf-blade base cuneate, with a brief petiole-like connection to sheath, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate, 5–30 cm long, 15–35 mm wide, mid-green or glaucous, with undersurface a different shade on either side of midrib. Leaf-blade venation with 8–12 secondary veins, with distinct cross veins.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1 fertile spikelets, subtended by a spatheole, embraced at base by subtending leaf. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–70 mm long, breaking up at maturity,

disarticulating below each fertile floret. Rhachilla internodes eventually visible between lemmas, pilose, hairy at tip.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume ovate, chartaceous, without keels. Lower glume apex acute. Upper glume ovate, chartaceous, without keels. Upper glume apex acute.

Florets. Fertile lemma ovate, 9 mm long, chartaceous, without keel, more than 3-veined. Lemma apex acuminate. Palea 1 length of lemma, 2 -veined. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Europe (*), Temperate Asia, South America (+).

Region. Northern Europe (*), Southwestern Europe.

Country /Province /State. : GB Aliens (Ryves et al). **China, Eastern Asia.** China Southeast. Japan. **Australia** (*). Lord Howe-Norfolk Is. **Brazil, Southern South America.** Brazil Southeast. Argentina Northeast.

Shanghai, Zhejiang. Sao Paulo. Entre Rios.

Arundinaria sulcata (Z.P. Wang & G.H. Ye) C.S. Chao & G.Y. Yang. *J. Bamboo Res.*, 13(1): 10 (1994).

Basionym or Replaced Name: *Oligostachyum sulcatum* Z.P. Wang & G.H. Ye, *J. Nanjing Univ., Nat. Sci.*, 1: 96 (1982).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sulcus*, furrow; -ata, possessing. Internodes grooved.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 1000–1200 cm long, 40–62 mm diam., woody. Culm-internodes terete, thin-walled, 37.5 cm long, distally mealy. Lateral branches dendroid, ascending. Branch complement three. Culm-sheaths present, coriaceous, green, hispid, hairy on margins, without auricles, glabrous on shoulders. Culm-sheath ligule 3.5 mm high, ciliolate. Culm-sheath blade lanceolate or narrowly ovate, erect or spreading. Leaves 3–5 per branch. Leaf-sheaths deciduous, 9–16 cm long, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule a ciliolate membrane, 1–1.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate. Leaf-blade venation with distinct cross veins.

Inflorescence. Inflorescence composed of racemes, bracteate at pedicel base. Racemes bearing 2–3 fertile spikelets on each. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–15 mm long.

Fertile Spikelets. Spikelets comprising 3–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–37 mm long, 1.5–3 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume lanceolate, 3–5 mm long, chartaceous, without keels. Lower glume lateral veins obscure. Lower glume surface scabrous. Lower glume apex acute. Upper glume elliptic, 7–10 mm long, chartaceous, without keels, 9 -veined. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma 11–13 mm long, chartaceous, without keel, 9–15 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface scabrous. Lemma apex acuminate, mucronate. Palea 2 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. **China.** China Southeast.

Fujian, Zhejiang.

Arundinaria viridistriata (Regel) Nakai. *J. Jap. Bot.* 10:568 (1934).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online (as *Pleioblastus*), W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983) (as *Pleioblastus*).

Basionym or Replaced Name: *Pleioblastus auricomus* (Mitford) Bergmans, *Vaste Pl. Rotsheest.*, ed. 2, 677 (1939).

Recent Synonyms: *Pleioblastus viridistriatus* (Regel) Makino, *Journ. Jap. Bot.* 3:11 (1926).

Illustrations (Journals): *Hooker's Icones Plantarum* (t.2613 (1899) as *A. auricoma*).

Derivation (Clifford & Bostock 2007): *L. viridis*, green; striatus, striated. Leaf-blades variegated.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes elongated, leptomorph. Butt sheaths absent. Culms erect, 20–60 cm long, 1–2 mm diam., woody. Culm-internodes terete, thin-walled, distally pubescent. Culm-nodes pubescent. Lateral branches lacking or sparse. Culm-sheaths present, puberulous, with reflexed hairs. Culm-sheath blade lanceolate, erect, 0.5 cm long. Leaf-sheaths puberulous. Leaf-sheath oral hairs setose. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades deciduous at the ligule, lanceolate, 15–20 cm long, 15–25 mm wide, mid-green and yellowish green, variegated (striped). Leaf-blade surface pubescent, densely hairy, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 40–50 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes one the lower absent or obscure, persistent, shorter than spikelet. Upper glume lanceolate, 10–23 mm long, chartaceous, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 13–15 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex acuminate. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 3. Caryopsis with adherent pericarp, apex unappendaged.

Distribution (TDWG). Continent. Temperate Asia, Australasia.

Country /Province /State. Caucasus, Eastern Asia. Transcaucasus. Japan. New Zealand (*). New Zealand North I, New Zealand South I.

Arundinaria walkeriana Munro. *Trans. Linn. Soc.* 26: 21 (1868).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Sri Lanka. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Sri Lanka: *Walker 1304* ; Sri Lanka: *Walker 96*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. In honor of George Warren (- 1844) British soldier and his wife A.W. Walker (-) who collected in Sri Lanka.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 100–200 cm long, woody. Culm-internodes terete, thin-walled, smooth. Lateral branches dendroid. Bud complement 1. Branch complement many, in a clump, thinner than stem. Culm-sheaths present, deciduous, yellow or green, pilose, hairy at the base, hairy on margins, without auricles, ciliate on shoulders, shoulders with 3–5 mm long hairs. Culm-sheath ligule 0.5–1 mm high, ciliate. Culm-sheath blade narrowly ovate, spreading, 2–3 cm long, 5 mm wide, acute. Leaves 10–20 per branch. Leaf-sheath oral hairs ciliate, 3–4 mm long. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blade base cordate, with a brief petiole-like connection to sheath, petiole 0.2–0.25 cm long. Leaf-blades deciduous at the ligule, elliptic, 5–15 cm long, 10–50 mm wide, indurate. Leaf-blade midrib prominent beneath. Leaf-blade venation with distinct cross veins. Leaf-blade margins cartilaginous, scabrous. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, 20–30 cm long. Panicle branches glabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–17 mm long.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 14–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent, hairy above.

Glumes. Glumes deciduous, similar, shorter than spikelet. Lower glume ovate, 5.8 mm long, chartaceous, without keels, 7 -veined. Lower glume margins ciliate. Lower glume apex acute. Upper glume ovate, 6.5 mm long, 0.2–0.33 length of adjacent fertile lemma, chartaceous, without keels, 7 -veined. Upper glume margins ciliate. Upper glume apex acute.

Florets. Fertile lemma ovate, 5–7.3 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma margins ciliate, hairy above. Lemma apex acute. Palea keels winged. Palea surface puberulous, hairy on back, hairy above. Palea apex ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.4 mm long, veined, ciliate. Anthers 3, 5 mm long, orange. Stigmas 3. Caryopsis with adherent pericarp, ellipsoid, sulcate on hilar side, 5 mm long, apex unappendaged. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India, Sri Lanka.

Arundinella barbinodis Keng ex B.S. Sun & Z.H.Hu. *Acta Bot. Yunnanica* 2(3): 329 (1980).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: Guangdong: Lechang Xian, Chong Uen Shan near Kan Fung, dry steep slope, sandy soil, 2–30 Nov. 1932, *W.T Tsang* 20782 (HT: Acad. Sin., Beijing; IT: LE (fragm.))

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 788).

Derivation (Clifford & Bostock 2007): *L. barba*, beard; *nodus*, knot. Nodes bearded.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Culms erect, 100 cm long, 3 mm diam., 1–2 -noded. Culm-internodes smooth. Culm-nodes swollen, bearded. Leaf-sheaths longer than adjacent culm internode, pilose, outer margin hairy. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades 5–35 cm long, 3–7 mm wide, glaucous. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 30–60 cm long. Primary panicle branches ascending or spreading, 1–2 -nate, 9–20 cm long. Panicle branches scaberulous, bearded in axils. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, 1–6 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.25 length of lemma.

Glumes. Glumes persistent, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5–4 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface smooth or asperulous, rough on veins. Lower glume apex acuminate. Upper glume ovate, 4.5–5.5 mm long, membranous, glaucous, 1-keeled, 7 -veined. Upper glume surface smooth or asperulous, rough on veins. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 4 mm long, membranous, glaucous, 1-keeled, 5 -veined, acute. Fertile lemma lanceolate, 2.5–3 mm long, coriaceous, light brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 3 -awned. Principal lemma awn straight, 6 mm long overall. Lateral lemma awns present, 2 mm long. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast.

Fujian, Guangdong, Hunan, Jiangxi, Zhejiang.

Arundinella bengalensis (Spreng.) Druce. *Rep. Bot. Exch. Cl. Brit. Isles* 1916, 605 (1917).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. **Basionym or Replaced Name:** *Panicum bengalense* Spreng., *Syst. Veg.* 1: 311 (1825). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: Bengal;.

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (751, Fig. 48), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 791).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Bengal, now Bangladesh.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, scaly, hairy. Culms erect or geniculately ascending, 100–200 cm long. Culm-nodes glabrous or bearded. Lateral branches lacking or sparse. Leaf-sheaths pilose, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane. Leaf-blades 20–60 cm long, 10–20 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous, glabrous or ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle contracted, linear, 15–30 cm long, 1–3 cm wide, contracted about primary branches. Primary panicle branches ascending, 1–2.5 cm long, bearing spikelets almost to the base. Panicle axis smooth or scabrous, with scattered hairs or hispid. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 2–2.75 mm long, 0.8 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface scabrous, rough on veins, glabrous or pilose, with tubercle-based hairs. Lower glume apex acute. Upper glume elliptic, 2.3–3.5 mm long, 1.1–1.7 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface smooth or asperulous, rough on veins, glabrous or pilose, with tubercle-based hairs. Upper glume apex acute or acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 2.5–3 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma oblong, 2 mm long, chartaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire or dentate, 2 -fid, muticous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 2 mm long overall, with twisted column. Palea with auriculate flaps, chartaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1–1.25 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Illustrations (Journals): *Ruizia* (13:422 Fig 56a-b (1993)).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Carlo Guisepppe Bertero (1789–1831) Italian botanist, physician, pharmacist and traveller.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 75–115 cm long, 1.5–2 mm diam. Culm-internodes thin-walled. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths hispid, with tubercle-based hairs. Leaf-sheath oral hairs bearded. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades 25–35 cm long, 3–6 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface pilose, hairy on both sides. Leaf-blade margins cartilaginous.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate, dense, 20–40 cm long, 4–6 cm wide, contracted about primary branches. Primary panicle branches appressed, 10–15 cm long. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets cuneate, laterally compressed, 4.2–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, recurved at apex or gaping. Lower glume lanceolate, 3.2–4.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acuminate. Upper glume lanceolate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, membranous, 1-keeled, 3–5 -veined, acute. Fertile lemma lanceolate, 1.5–1.8 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight or geniculate, 8–13 mm long overall, without a column or with a straight or slightly twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.6–0.7 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Arundinella birmanica Hook. f. *Fl. Brit. Ind.* 7: 73 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Burma, now Myanmar.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, robust, 20–35 cm long. Culm-nodes bearded. Lateral branches lacking. Leaf-sheaths pilose, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blade base broadly rounded. Leaf-blades linear or lanceolate, 15–27 cm long, 7–14 mm wide, flaccid. Leaf-blade surface hirsute, hairy on both sides, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle pilose above. Panicle open, elliptic, 5–15 cm long, contracted about primary branches. Primary panicle branches 2–4 cm long. Panicle axis scaberulous, with scattered hairs. Panicle branches scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, scabrous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, recurved at apex or gaping. Lower glume elliptic, 3–3.25 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex acuminate, awned, 1 -awned. Upper glume elliptic, 4.5–4.75 mm long, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume primary vein scabrous. Upper glume apex caudate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 3 mm long, 1 length of spikelet, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma elliptic or oblong, 2 mm long, coriaceous, dark brown, without keel. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with twisted column. Column of lemma awn 2.5 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.75–1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Myanmar.

Arundinella blephariphylla (Trimen) Trimen ex Hook. f. *Fl. Brit. Ind.* 7: 77 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Sri Lanka. **Basionym or Replaced Name:** *Panicum blephariphyllum* Trimen, *Journ. Bot. Brit. & For.* 23: 272 (885)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: "Hab. Ruanwelle, Western Prov., Nov. 1883, ...", *Mr. Ferguson s.n.*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *blepharis*, eye-lash; *phyllon*, leaf. The leaf margins bear long stiff widely separated hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Butt sheaths glabrous. Culms erect, 30–60 cm long. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface or pubescent, with tubercle-based hairs. Ligule an eciliate membrane, 0.2 mm long. Leaf-blade base broadly rounded. Leaf-blades 15–35 cm long, 10–25 mm wide, membranous. Leaf-blade surface smooth, glabrous. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle pilose above. Panicle open, ovate, 12 cm long, contracted about primary branches. Primary panicle branches simple. Panicle axis scabrous. Panicle branches bearing approximate spikelets. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 2.5 mm long, 0.75 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acute. Upper glume elliptic, 3.5 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 2.75 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma oblong, 1.75 mm long, coriaceous, light brown, without keel, 3 -veined, 0-3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, obtuse, muticous. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface pubescent, hairy above, with turgid hairs.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1-1.2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Sri Lanka.

Arundinella kannanorica V.J. Nair, Sreek. & N.C. Nair. *J. Bombay Nat. Hist. Soc.* 80(2): 396 (1984).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from India. T: <Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Cannanore District, Kumbala to Beduka: Sreekumar 71822 (CAL holo, K, MH).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, slender, 20-60 cm long. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 1-8 cm long, striately veined, outer margin glabrous or hairy. Ligule a fringe of hairs. Leaf-blade base broadly rounded. Leaf-blades lanceolate, 2-5 cm long, 2-5 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy, with tubercle-based hairs. Leaf-blade margins glabrous or tuberculate-ciliate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, ovate, 10-40 cm long. Primary panicle branches ascending, 1-12 cm long. Panicle branches angular, bearded in axils. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, angular, 2-15 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, acuminate, 4-6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.25-0.5 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5-4.5 mm long, 0.75 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume lateral veins prominent. Lower glume apex acute. Upper glume ovate, 5-5.5 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, mid-green and purple, 5 -veined. Upper glume lateral veins prominent. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 2.75-3 mm long, membranous, light green, 1-keeled, 5 -veined, obscurely veined, with unevenly spaced veins, obtuse. Palea of lower sterile floret 2-2.5 mm long. Fertile lemma ovate, 1.75-2 mm long, coriaceous, dark brown, without keel. Lemma surface papillose. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn from

a sinus, geniculate, 8–10 mm long overall, with twisted column. Column of lemma awn 4 mm long. Palea with auriculate flaps, 1.25–1.5 mm long, coriaceous, 2 -veined. Palea surface papillose.

Flower and Fruit. Lodicules 2, cuneate, 0.3 mm long, fleshy. Anthers 3, 1–2 mm long, purple.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Kerala.

Arundinella ciliata (Roxb.) Nees ex Miq. *Verh. Nederl. Inst.* 3, 4: 30 (1851).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

Basionym or Replaced Name: *Holcus ciliatus* Roxb., *Fl. Ind.* 1: 321 (1820).

Illustrations (Books): K.M.Mathew, Illustrations on the *Flora of Tamilnadu Carnatic* (1982) (Pl. 810 & 811), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Fig. 205).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Pl. 12).

Derivation (Clifford & Bostock 2007): *L. cilium*, eyelid; *-ata*, possessing. Plant hairy overall or in part.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–60 cm long. Culm-internodes distally glabrous or pilose. Culm-nodes bearded. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, pilose, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane or a ciliate membrane. Leaf-blade base broadly rounded. Leaf-blades lanceolate or oblong, 7–15 cm long, 7–14 mm wide, flaccid. Leaf-blade surface pilose, hairy adaxially or on both sides, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle contracted, linear, 5–12 cm long, contracted about primary branches. Primary panicle branches 1–3(–5) cm long. Panicle axis scabrous, glabrous or pilose, with tubercle-based hairs. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume elliptic, 2.5–3.5 mm long, 0.75–1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface pilose, hairy below, with tubercle-based hairs. Lower glume apex acute, awned, 1 -awned. Upper glume elliptic, 3.5 mm long, 2.5–3 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, hairy below, with tubercle-based hairs. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic or oblong, 1.25–2.5 mm long, 0.5–0.75 length of spikelet, membranous, 1-keeled, 3 -veined, acute, awned. Fertile lemma elliptic or oblong, 1–1.5 mm long, coriaceous, pallid, without keel. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–7 mm long overall, with twisted column. Column of lemma awn 2.5–3 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.25–0.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$n = 9$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Malesia. Lesser Sunda Is, Philippines. Tamilnadu.

Arundinella cochinchinensis Keng. *Nat. Centr. Univ. Sci. Rep., Nanking, Ser. B*, 2 No. 3, 24 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 795).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Cochinchina, now included in Laos and Cambodia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Culms erect, robust, 250 cm long, 4–6 mm diam. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, glabrous on surface, outer margin glabrous or hairy. Ligule an eciliate membrane. Leaf-blades 60 cm long, 20 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle contracted, oblong, interrupted, 60 cm long. Primary panicle branches appressed, bearing spikelets almost to the base. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, 1–4 mm long, scaberulous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, recurved at apex. Lower glume lanceolate or ovate, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate. Upper glume lanceolate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 3–5 -veined. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 1 length of spikelet, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma lanceolate, 2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4 mm long overall, with twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China Southeast. **Indo-China.** Thailand, Vietnam.

Guangxi, Guizhou, Yunnan.

Arundinaria wightiana Nees. *Linnaea* 9: 482 (1834).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations (Books): K.M.Matthew, *Flora Palni Hills* (1996) (as *Sinarundinaria wightiana*).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Robert Wight (1796–1872) Scots-born physician and sometime Superintendent, Botanic Gardens, Madras.

Classification. Subfamily Bambusoideae. Tribe: Arundinarieae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 200–300 cm long, woody, without nodal roots. Culm-internodes semiterete, 25–35 cm long, dark green, striate, scaberulous. Culm-nodes swollen. Lateral branches dendroid. Branch complement several, in a clump, with subequal branches, thinner than stem. Culm-sheaths present, 10–20 cm long, 3–4 times as long as wide, yellow, hispid, with tawny hairs, without auricles. Culm-sheath ligule ciliolate. Culm-sheath blade linear, 2.5–4 cm long, scabrid. Leaf-sheaths keeled, striately veined, glabrous on surface or pilose, with tubercle-based hairs. Leaf-sheath oral hairs setose. Ligule an eciliate membrane, erose. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 12–18 cm long, 20–25 mm wide. Leaf-blade venation with 10–14 secondary veins, with distinct cross veins. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate. Panicle branches capillary, flexuous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes flattened, clavate, pubescent.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume oblong, chartaceous, without keels. Lower glume apex acute. Upper glume oblong, chartaceous, without keels, 7 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, 6–7 mm long, chartaceous, without keel, 9–11 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma surface smooth or scabrous. Lemma apex obtuse, mucronate. Palea 7 -veined. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, veined, ciliate. Anthers 3. Ovary glabrous. Caryopsis with adherent pericarp, ellipsoid, sulcate on hilar side, 2.5–5 mm long, apex unappendaged.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Arundinella dagana H.J. Noltie. *Edinburgh J. Bot.*, 56(3): 396 (1999).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (751, Fig. 48).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating connection. From Daga Dzang, Kingdom of Bhutan.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, scaly, hairy. Culms erect or geniculately ascending, 100–200 cm long. Culm-nodes glabrous or bearded. Lateral branches lacking or sparse. Leaf-sheaths pilose, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane. Leaf-blades 20–60 cm long, 10–20 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous, glabrous or ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle contracted, linear, 15–30 cm long, 1–3 cm wide, contracted about primary branches. Primary panicle branches ascending, 1–2.5 cm long, bearing spikelets almost to the base. Panicle axis smooth or scabrous, with scattered hairs or hispid. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 3–3.2 mm long, 0.9 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface hispid. Lower glume apex acute. Upper glume elliptic, 3.2–3.8 mm long, 1.2–1.3 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface hispid. Upper glume apex acute or acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 2.5–3 mm long, membranous, 1-keeled, 5 -veined, acute. Palea of lower sterile floret 1.7–1.9 mm long. Fertile lemma oblong, 2.4–2.8 mm long, chartaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire or dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 1.1–2.5 mm long overall, clearly exerted from spikelet, with twisted column, persistent. Column of lemma awn 0.8–1 mm long. Palea with auriculate flaps, chartaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.7–0.9 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Eastern Himalaya.

Bhutan.

Arundinella decempedalis (Kuntze) Janowsky. Fedde, *Repert.* 17: 84 (1921).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Panicum decempedale* Kuntze, *Rev. Gen.* 783. (1891).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (751, Fig. 48), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 791).

Derivation (Clifford & Bostock 2007): *L. decem*, ten; *pes*, foot. Culms to about 3 m tall.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Rhizomes elongated, scaly. Culms robust, 200–300 cm long. Culm-nodes pubescent. Lateral branches lacking. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades 80–120 cm long, 10–30 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface smooth or scabrous, glabrous or pubescent, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle scaberulous above. Panicle open, lanceolate, dense, 25–50 cm long, 7–15 cm wide, contracted about primary branches. Primary panicle branches ascending, simple, 8–20 cm long. Panicle axis scaberulous. Panicle branches scabrous, bearded in axils. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, scabrous, bearing a few hairs or glabrous, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 2.5–3 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acute. Upper glume lanceolate, 1.6 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 3 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate or elliptic, 2.5 mm long, chartaceous, 1-keeled, 3 -veined, obtuse. Fertile lemma lanceolate, 2 mm long, coriaceous, light brown, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, mucicous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 2–4 mm long overall, with twisted column. Column of lemma awn 1–2 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1–1.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Embryo 0.6 length of caryopsis. Hilum punctiform.

$n = 30$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent, Indo-China.** Assam, Eastern Himalaya, India. Myanmar.

Yunnan. Sikkim. Assam. West Bengal.

Arundinella deppeana Nees. *Bonplandia*, 3: 84 (1855).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (64, Fig. 16).

Derivation (Clifford & Bostock 2007): in honor of Ferdinand Deppe (1794–1861) German botanist and traveller.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Culms erect or geniculately ascending, robust, 100–400 cm long, 3–7 mm diam. Culm-internodes thin-walled. Culm-nodes pubescent. Leaf-sheaths hispid, with tubercle-based hairs, outer margin hairy. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades 25–50 cm long, 8–25 mm wide. Leaf-blade surface hispid, hairy on both sides.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle 4–30 cm long, glabrous. Panicle open, lanceolate, dense, 20–60 cm long, contracted about primary branches. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.8–4.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 2.8–3.2 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex attenuate. Upper glume lanceolate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume apex attenuate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 2.3–2.5 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma lanceolate, 1.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 10–13 mm long overall, with a straight or slightly twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.7–1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico, Southeast Mexico. **Mesoamerica, Caribbean, Brazil.** Cuba. Brazil Southeast.

Distrito Federal, Mexico State, Morelos, Puebla. Hidalgo, Neuvo Leon, Queretaro. Veracruz. Sinaloa. Colima, Guerrero, Jalisco, Michoacan, Nayarit, Oaxaca. Campeche, Chiapas, Quintana Roo, Tabasco, Yucatan.

Arundinella flavida Keng. *Nat. Centr. Univ. Sci. Rep.*, Nanking, Ser. B, 2 No. 3, 44 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 790).

Derivation (Clifford & Bostock 2007): *L. flavidus*, pale yellow. Spikelets yellow.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, scaly. Culms erect, 50–120 cm long, 2–3 mm diam. Culm-nodes glabrous or pubescent. Lateral branches fastigiate, arising from lower culm. Leaf-sheaths glabrous on surface or hispid, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane, 0.2 mm long. Leaf-blades erect or ascending, (6–)15–30 cm long, 6–10 mm wide, indurate, stiff. Leaf-blade midrib indistinct. Leaf-blade surface smooth, glabrous, hairless except near base. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic or oblong, dense, 9–15(–27) cm long. Primary panicle branches ascending, simple or sparsely divided, 1.5–7 cm long. Panicle axis scabrous. Fertile spikelets pedicelled. Pedicels present, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose. Floret callus hairs 0.25 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 3.1–3.7 mm long, 0.8–0.9 length of upper glume, membranous, light brown, 1-keeled, 3(–5) -veined. Lower glume lateral veins ribbed. Lower glume surface setose, hairy on veins, with tubercle-

based hairs. Lower glume apex acuminate. Upper glume lanceolate, 3.8–4.1 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, light brown, 1-keeled, 3(–5) -veined. Upper glume lateral veins ribbed. Upper glume surface setose, hairy on veins, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 3.1–3.7 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma lanceolate, 2–2.5 mm long, coriaceous, without keel. Lemma margins involute, interlocking with palea keels. Lemma apex entire, awned, 1 -awned. Principal lemma awn geniculate, 2.2–3 mm long overall, with twisted column. Palea coriaceous, 2 -veined.

Flower and Fruit. Lodicules 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China Southeast. **Indo-China.** Vietnam. Guangxi. Guizhou.

Arundinella fluviatilis Hand.-Mazz. *Anz. Akad. Wiss. Wien, Math.-Nat.* 63: 111 (1926).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. fluvius*, river; *-atalis*, place of growth. Growing along riverbanks.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 35–90 cm long. Leaf-sheaths 8–10 cm long, mostly shorter than adjacent culm internode, outer margin hairy. Ligule a ciliolate membrane, 1 mm long. Leaf-blades 10–20 cm long, 3–5 mm wide. Leaf-blade surface pilose. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–20 cm long. Primary panicle branches 1–2 -nate, 2–5 cm long. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, 1–4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets cuneate, dorsally compressed, 4.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 0.66–1 length of upper glume, membranous, 1-keeled, 5 -veined. Lower glume apex acuminate. Upper glume ovate, 4.5–5 mm long, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 4.5–5 mm long, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma ovate, 3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn straight, 1–1.25 mm long overall. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2 mm long, purple. Stigmas 2. Caryopsis with adherent pericarp, 1.75 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, China Southeast. Hunan, Jiangxi. Guizhou, Hubei, Sichuan.

Arundinella furva Chase. *Journ. Arn. Arb.* 24: 85 (1943).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Guinea, Sarawaket: *Clemens 5826a* .

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. dusky, almost black. Lemmas darkish purple-brown.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal. Culms erect or geniculately ascending, 75–95 cm long, without nodal roots or rooting from lower nodes. Culm-internodes smooth, distally glabrous. Culm-nodes pubescent. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane, 3–5 mm long. Leaf-blades ascending, 5.5–10.5 cm long, 5–10 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous, ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate, 10–16 cm long, 1–1.5 cm wide. Panicle axis scabrous. Panicle branches angular, scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1 in the cluster or 2 in the cluster. Pedicels present, angular, 1–3 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.5–1 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 4–5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acuminate. Upper glume ovate, 5–6 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume surface smooth. Upper glume apex acuminate.

Florets. Basal sterile florets 1, barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 5–6 mm long, membranous, 1-keeled, 3 -veined, acuminate. Fertile lemma ovate, dorsally compressed, 3 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 3–4 mm long overall, with twisted column. Palea with auriculate flaps, 1 length of lemma, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Papuasias. New Guinea.

Arundinella fuscata Steud. *Syn. Pl. Gram.* 116 (1854).

Accepted by: U. Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Java: *Goering 138*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *fuscus*, dark; *-ata*, possessing. Spikelets invested with dark hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 25–125 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths pilose, with tubercle-based hairs. Ligule a ciliate membrane. Leaf-blades 3.5–26 cm long, 4–15 mm wide, mid-green. Leaf-blade surface smooth, pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open or contracted, lanceolate, equilateral or nodding, 5–35 cm long. Panicle axis scabrous. Panicle branches angular. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1 in the cluster or 2 in the cluster. Pedicels present, angular, 0.5–6.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 2.75–3.75 mm long, 0.66 length of upper glume, membranous, purple, 1-keeled, 5 -veined.

Lower glume surface glabrous or pilose. Lower glume apex acute, mucicous or mucronate. Upper glume ovate, 4.5–5.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 5 -veined. Upper glume surface glabrous or pilose. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 2.75–3.75 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma ovate, dorsally compressed, 2–2.25 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, awned, 1 -awned. Principal lemma awn geniculate, 4.5–7 mm long overall, with twisted column. Palea with auriculate flaps, 1 length of lemma, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Java, Sumatra, Sulawesi.

Arundinella goeringii Steud. *Syn. Pl. Gram.* 116 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Java: Goering 138.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Philip Friedrich Wilhelm Goering (1809–79) German botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 25–125 cm long. Culm-internodes smooth, distally glabrous. Leaf-sheaths pilose, with tubercle-based hairs. Ligule a ciliate membrane. Leaf-blades 3.5–26 cm long, 4–15 mm wide, mid-green. Leaf-blade surface smooth, pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open or contracted, lanceolate, equilateral or nodding, 5–35 cm long. Panicle axis scabrous. Panicle branches angular. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1 in the cluster or 2 in the cluster. Pedicels present, angular, 0.5–6.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 2.75–3.75 mm long, 0.66 length of upper glume, membranous, purple, 1-keeled, 5 -veined. Lower glume surface glabrous or pilose. Lower glume apex acute, mucicous or mucronate. Upper glume ovate, 4.5–5.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 5 -veined. Upper glume surface glabrous or pilose. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 2.75–3.75 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma ovate, dorsally compressed, 2–2.25 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, awned, 1 -awned. Principal lemma awn geniculate, 4.5–7 mm long overall, with twisted column. Palea with auriculate flaps, 1 length of lemma, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Java, Philippines, Sulawesi, Sumatra.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Philippines.

Arundinella grandiflora Hackel. Fedde, *Repert. Nov. Sp.* 8: 514 (1910).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 796).

Derivation (Clifford & Bostock 2007): *L. grandis*, large; *flos*, flower. Spikelets with more florets than those of related species.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 40–70 cm long, 3-noded. Culm-internodes distally glabrous. Culm-nodes glabrous or pubescent. Lateral branches lacking. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule a ciliolate membrane. Leaf-blades linear or lanceolate, 15 cm long, 7 mm wide, stiff. Leaf-blade surface smooth, glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 16 cm long, 2 cm wide. Primary panicle branches appressed, 1–2-nate, 4–8 cm long. Panicle axis smooth. Panicle branches glabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 5-veined. Lower glume lateral veins prominent. Lower glume surface scabrous, rough on veins. Lower glume apex acuminate, mucronate. Upper glume ovate, 7 mm long, membranous, 1-keeled, 5-veined. Upper glume lateral veins prominent. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 6 mm long, membranous, 1-keeled, 5-veined, acute. Palea of lower sterile floret 0.75 length of lemma. Fertile lemma oblong, 3.5 mm long, coriaceous, without keel, 5-veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex obtuse, awned, 1-awned. Principal lemma awn geniculate, 6 mm long overall, with twisted column. Palea 1 length of lemma, coriaceous, 2-veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.

Yunnan.

Arundinella grevillensis B.K. Simon. *Austrobaileya* 1(5): 463 (1983).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, D.Sharp, D. & B.K.Simon, *AusGrass* (2002), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Australia, Queensland. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Australia: Queensland: Mt. Greville, *Simon & Sharpe 2528* (HT: BRI-227421; IT: CANB).

Illustrations (Books): T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (190, Fig. 29), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Mt. Greville, south-east Queensland, Australia.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Butt sheaths woolly. Culms 12–25 cm long. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, striately

veined, pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 1 mm long. Leaf-blades filiform, involute, 2–4 cm long, 1 mm wide. Leaf-blade surface pilose, sparsely hairy, with tubercle-based hairs.

Inflorescence. Inflorescence a panicle, comprising 3–17 fertile spikelets, bearing juvenile spikelets at emergence. Panicle open, oblong, 4–8 cm long, bearing few spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 5 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 4 mm long, 0.75 length of upper glume, membranous, 1-keeled, 7 -veined. Lower glume primary vein scaberulous. Lower glume apex acuminate. Upper glume ovate, 5 mm long, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 5 mm long, membranous, 1-keeled, 5 -veined, acute. Palea of lower sterile floret 3.5 mm long. Fertile lemma ovate, 2.5 mm long, coriaceous, without keel. Lemma surface scabrous. Lemma margins involute, interlocking with palea keels. Lemma apex truncate, awned, 1 -awned. Principal lemma awn geniculate, 4.5 mm long overall, with twisted column. Palea with auriculate flaps, 3 mm long, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 1 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.
South East.

Arundinella helferi ms. Veldk.

Accepted by: J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Arundinella hirta (Thunb.) Tanaka. *Bull. Sc. Hort. Inst. Kyushu Imp. Univ.* 1: 196, 208 [Sept.] (1925).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

Basionym or Replaced Name: *Agrostis ciliata* Thunb., *Fl. Jap.* 49 (1784).

Illustrations (Books): N.N.Tsvelev, *Grasses of the Soviet Union* (1983) (987 (653), Pl.15), T.Koyama, *Grasses of Japan and its neighbouring regions* (1987) (295, Fig. 114), C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (458), C-C Hsu, *Taiwan Grasses* (1975), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 792).

Derivation (Clifford & Bostock 2007): L. hairy. Hairy in part or extensively.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes elongated. Culms 50–120 cm long, 1.5–5 mm diam., 4–6 -noded. Culm-internodes distally glabrous or hirsute. Culm-nodes glabrous or pubescent or bearded. Leaves basal and cauline. Leaf-sheaths glabrous on surface to hirsute, outer margin hairy. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades 7–40 cm long, 5–13 mm wide. Leaf-blade surface glabrous to pilose, hairy on both sides. Leaf-blade apex abruptly acute to acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate or elliptic, dense or loose, 15–50 cm long, 1.5–9 cm wide, contracted about primary branches. Primary panicle branches 2–17 cm long, bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches scabrous, glabrous or pubescent. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, scabrous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse. Floret callus hairs 0.33–0.5 length of lemma.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3–3.7 mm long, 0.7–0.9 length of upper glume, chartaceous, 1-keeled, 3–5 -veined. Lower glume apex acute. Upper glume ovate, 1.5 length of adjacent fertile lemma, 1 length of spikelet, chartaceous, 1-keeled, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3–3.25 mm long, membranous, 1-keeled, 3(–5) -veined, acute. Fertile lemma lanceolate or ovate, 2.5–3.2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, acuminate, muticous. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2.2–2.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 24$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. Siberia, Russian Far East, **China, Mongolia, Eastern Asia, Russia.** Buryatiya, Chita. Amur, Primorye. China South Central, Inner Mongolia, Manchuria, China North-Central, China Southeast, Tibet, Xinjiang. Japan Hokkaido, or Honshu, or Shikoku, or Kyushu. Japan, Korea, Taiwan.

Hebei, Shaanxi, Shandong. Anhui, Fujian, Guangdong, Guangxi, Henan, Hunan, Jiangsu, Jiangxi, Zhejiang. Guizhou, Hubei, Sichuan, Yunnan. Assam.

Arundinella hispid (Willd.) Kuntze. *Rev. Gen.* 761 (1891).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Andropogon hispidus* Willd., *Sp. Pl.* 4 : 908 (1806).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (252), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (155, Fig. 99 as *A. confinis*), S.A.Renvoize, *Gramineas de Bolivia* (1998) (561, Fig. 130), S.A.Renvoize, *The Grasses of Bahia*, 1984 (98, Fig. 34), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (39, Fig. 20), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (593, 129), A.Burkat, *Flora Ilustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (446, Fig. 189), B.Rosengurtt, *Gramineas Uruguayas I* (1970) (220, Fig. 90), G.Harling & C.Persson, *Flora of Ecuador* (2006) (78: 171, Fig. 20 (2006)), E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (76, Fig. 10).

Derivation (Clifford & Bostock 2007): L. bearing coarse stiff hairs. Plant wholly or partly rough to the touch.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 95–185 cm long, 4–5 mm diam. Culm-internodes thin-walled. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths hispid. Ligule an eciliate membrane, 0.2–0.3 mm long. Leaf-blades 20–25 cm long, 9–16 mm wide. Leaf-blade surface hispid, hairy adaxially or on both sides, with tubercle-based hairs.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle open, lanceolate, dense, 25–30 cm long, contracted about primary branches. Primary panicle branches bearing spikelets almost to the base. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.7–4.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 2.2–2.9 mm long, 0.66 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume lateral veins ribbed. Lower glume surface scabrous. Lower glume apex acute. Upper glume lanceolate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 3–5 -veined. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 1.5–2.1 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma lanceolate, 1.5–2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4–6 mm long overall, with twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.8–0.9 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia, South America.

Arundinella holcoides (Kunth) Trin. *Bull. Sc. Acad. Petersb.* 1: 71 (1836).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)* (& as *A. agrostoides*), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Brandtia holcoides* Kunth, *Rev. Gram.* 2 : 511. t. 170 (1831).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Holcus* with respect to the inflorescence.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Butt sheaths pilose. Culms decumbent, 20–45 cm long. Culm-nodes bearded. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades linear or lanceolate, 7–15 cm long, 3–10 mm wide, flaccid. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous or pilose above. Panicle open, lanceolate or oblong, 7–15 cm long, 1–2 cm wide, contracted about primary branches. Primary panicle branches 1–6 -nate, 1–3 cm long. Panicle axis scaberulous, pilose, with tubercle-based hairs. Panicle branches scabrous, pilose, bearded in axils. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume elliptic, 2–2.5 mm long, 0.66–0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex acuminate, awned, 1 -awned. Upper glume elliptic, 3–3.5 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, with tubercle-based hairs. Upper glume apex caudate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 1.5–2 mm long, 1 length of spikelet, membranous, 1-keeled, 3 -veined, acute. Fertile lemma elliptic or oblong, 1 mm long, coriaceous, without keel. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex

dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5 mm long overall, with twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.25–0.4 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China, Malesia. India. Myanmar, Thailand. Lesser Sunda Is, Philippines.

Kerala, Karnataka. Madhya Pradesh, Maharashtra, Tamilnadu.

Arundinella hookeri Munro ex Keng. *Nat. Centr. Univ. Sci. Rep., Ser. B. Biol.*, 2 No. 3, 50 (1936).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China 22* (Poaceae) (2006), J.F.Veldkamp, *Poaceae ms (Flora Malesiana)*, N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Recent Synonyms: *Arundinella chenii* Keng, *Nat. Centr. Univ. Sci. Rep., Nanking, Ser. B*, 2 No. 3, 51, reimpr. (1936).

Illustrations (Books): H.J.Noltie, *The Grasses of Bhutan* (2000) (751, Fig. 48), S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 790).

Derivation (Clifford & Bostock 2007): in honor of Joseph Dalton Hooker (1817–1911), English botanist, traveller and Garden's Director.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths glabrous. Culms erect, 20–45 cm long. Culm-internodes distally glabrous. Culm-nodes glabrous. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades lanceolate, 3–12 cm long, 3–6 mm wide. Leaf-blade surface scaberulous, rough on both sides, pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scaberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle contracted, linear, 10–15 cm long, contracted about primary branches. Primary panicle branches 1.5–2 cm long, bearing spikelets almost to the base. Panicle axis glabrous or pilose. Panicle branches scabrous, pilose. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume elliptic, 4–4.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface pilose, hairy on veins, with tubercle-based hairs. Lower glume apex acuminate. Upper glume elliptic, 5–6 mm long, 2–2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, hairy on veins, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 4 mm long, 1 length of spikelet, membranous, 1-keeled, 5 -veined, scabrous, rough on midvein, acute. Fertile lemma elliptic or oblong, 2.25–2.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 3–4 mm long overall, with twisted column. Column of lemma awn 1.5 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.25–1.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, Tibet. **Indian Subcontinent, Indo-China.** Eastern Himalaya, India, Nepal. Myanmar.

Guizhou, Sichuan, Yunnan. Darjeeling, Bhutan, Sikkim. West Bengal.

Arundinella intricata Hughes. *Kew Bull.* 1920, 112 (1920).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India, Ritung: *Burkill 373*; India, Mahadeo: *Clarke 155622*; India, Khasia Hills: *Clarke 16588*; India, Boga Pance: Hooker 2001.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. intricata*, entangle. Inflorescence branches entangled.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated. Culms erect or geniculately ascending, 30–60 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface, outer margin hairy. Ligule a ciliate membrane. Leaf-blades involute, 10–20 cm long, 2–3 mm wide, coriaceous, stiff. Leaf-blade margins ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate or ovate, dense, 5–13 cm long, contracted about primary branches. Panicle axis pilose. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 3 mm long, 0.75 length of upper glume, membranous, purple, 1-keeled, 3–5 -veined. Lower glume surface smooth, glabrous. Lower glume apex acute. Upper glume elliptic, 4–4.5 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 4–4.5 mm long, 1 length of spikelet, membranous, 1-keeled, 5 -veined, acute. Fertile lemma elliptic or oblong, 2–3 mm long, coriaceous, pallid, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–6 mm long overall, with twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. Tibet. **Indian Subcontinent.** Assam, Eastern Himalaya, India. Arunachal Pradesh. Meghalaya.

Arundinella kengiana N.X. Zhao. *Guihaia* 12(3): 219–221, f. 1.. 1992.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Keng Yi-li (1894–1975) Chinese agrostologist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China Southeast. Anhui.

Arundinella kerrii Teerawat. & Sungkaew. *Novon* 21: 149 (2011).

TYPE from Thailand. **Basionym or Replaced Name:** Nakhon Phanom: Tha Uthen, ca.200 m, 16 Feb 1924, *A.F.G.Kerr 8474* (holo, BK; iso, BM, K).

Illustrations (Journals): *Novon* (21: 150: Fig.1 (2011)).

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms erect, 30–120 cm long. Culm-nodes brown. Leaf-

sheaths 9–16 cm long, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 0.5–0.6 mm long. Leaf-blades (8–)20–50(–70) cm long, 3–8 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous, tuberculate-ciliate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle contracted, elliptic, 5–15 cm long, contracted about primary branches. Primary panicle branches 1.5–5 cm long. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, 0.2–2 mm long, scabrous, setose.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, laterally compressed, 3–3.6 mm long, 1–1.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent. Floret callus hairs 0.2–0.3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 2.5–3 mm long, 1 length of upper glume, chartaceous, 1-keeled, 3–5 -veined. Lower glume surface hispid, hairy on veins, with tubercle-based hairs. Lower glume apex acute. Upper glume oblong or ovate, 2.5–3.5 length of adjacent fertile lemma, chartaceous, 1-keeled, 5 -veined. Upper glume surface hispid, hairy on veins, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong or ovate, 2.5–3 mm long, membranous, 1-keeled, 5–7 -veined, ciliate on margins, fringed above, acute. Palea of lower sterile floret 2.5–2.7 mm long. Fertile lemma oblong or ovate, 1.8–2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma margins involute, interlocking with palea keels. Lemma apex entire or dentate, 2 -fid, mucronate. Principal lemma awn 0.5–0.6 mm long overall. Palea oblong or ovate, with auriculate flaps, 1.8–2 mm long, coriaceous, 2 -veined. Palea apex acute.

Flower and Fruit. Anthers 3, 0.9–1.6 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Thailand.

Arundinella khasiana Nees ex Steud. *Syn. Pl. Gram.* 115 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 789).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating location. From the Khasia Hills, India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms robust, 50–105 cm long. Culm-nodes pubescent. Leaf-sheaths scaberulous, pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades conduplicate or involute, 15–45 cm long, 4–6 mm wide, stiff. Leaf-blade surface scaberulous, rough on both sides, glabrous or pubescent, hairy on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle smooth or scaberulous above. Panicle open, lanceolate, dense or loose, 15–50 cm long, 5–10 cm wide. Primary panicle branches ascending, 5–11 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, scabrous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5.5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 4–4.5 mm long, 0.75 length of upper glume, membranous, purple, 1-keeled, 5 -veined. Lower glume surface scabrous, rough on veins, pilose, with tubercle-based hairs. Lower glume apex acuminate. Upper glume ovate, 5.5 mm long, 1.5 length of adjacent fertile lemma, membranous, purple, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins, pilose, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 5.5 mm long, membranous, 1-keeled, 2 -veined, acuminate. Fertile lemma oblong, 3–4 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 5–6 mm long overall, with twisted column. Column of lemma awn 2 mm long. Lateral lemma awns present, arising on apex of lobes, 1 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.5–2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central. **Indian Subcontinent, Indo-China.** Assam, India, Myanmar.

Yunnan, Assam, Meghalaya, Nagaland.

Arundinella laxiflora Hook. f. *Fl. Brit. Ind.* 7: 75 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from Sri Lanka. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Sri Lanka, Central Province: *Thwaites CP 919* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. laxus*, loose; *flos*, flower. Inflorescence an open panicle.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Rootstock not evident, or evident. Culms slender, 30–70 cm long. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface or pilose, with tubercle-based hairs. Ligule a ciliate membrane. Leaf-blades flat or conduplicate or convolute, 7–15 cm long, 3–7 mm wide. Leaf-blade surface smooth, glabrous or pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle open, ovate, 3–6 cm long. Panicle axis smooth. Panicle branches smooth. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, 12–16 mm long, smooth or scaberulous, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 3 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough above. Lower glume apex acute. Upper glume ovate, 4.25 mm long, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface asperulous, rough on veins. Upper glume apex rostrate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 3 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma oblong, 2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, mucicous or awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4 mm long overall, with twisted column. Column of lemma awn 1 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.25–1.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India, Sri Lanka.
Maharashtra.

Arundinella leptochloa (Steud.) Hook. f. *Fl. Brit. Ind.* 7: 76 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Panicum leptochloa* Nees ex Steud., *Syn. Pl. Gram.* 62 (1854).

Illustrations (Books): G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 206).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)
(Pl. 12).

Derivation (Clifford & Bostock 2007): Gk. *leptos*, slender; *chloa*, grass. Inflorescence a slender spike.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths glabrous. Culms 100–200 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface or pilose, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blade base broadly rounded. Leaf-blades linear or lanceolate, 10–60 cm long, 5–35 mm wide, coriaceous. Leaf-blade surface smooth, glabrous, hairless except near base. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous. Panicle open, elliptic or oblong, 20–45 cm long, 10–20 cm wide, contracted about primary branches. Primary panicle branches 5–15 cm long. Panicle axis scabrous. Panicle branches bearing congested spikelets, scabrous, bearded in axils. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 2.5–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 2 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acute. Upper glume ovate, 2.5–3 mm long, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex acute.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 2.5–3.5 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma elliptic or oblong, 1 mm long, chartaceous, light brown, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, obtuse, muticous. Palea with auriculate flaps, chartaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1 mm long. Stigmas 2. Caryopsis with adherent pericarp, 1 mm long. Embryo 0.5 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India, Sri Lanka.
Goa, Karnataka. Maharashtra, Tamilnadu.

Arundinella longispicata B.S.Sun. *J. Yunnan Univ.* 21:94 (1999).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *longus*, long; *spica*, a point; hence, in particular, an ear or spike of grain.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped loosely. Rhizomes elongated. Culms geniculately ascending, 35–90 cm long, 3 mm diam., 5 -noded. Culm-internodes distally glabrous. Culm-nodes bearded. Leaf-sheaths longer than adjacent culm internode, hispid, with tubercle-based hairs. Ligule an eciliate membrane, 0.5 mm long. Leaf-blades 24–33 cm long, 7–8 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface hispid, with tubercle-based hairs. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate, 30–50 cm long. Primary panicle branches ascending, whorled at most nodes, 10–20 cm long. Panicle axis scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, unequal, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4.7–4.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Spikelet callus pilose. Spikelet callus hairs 0.5 length of spikelet.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 4.2 mm long, 0.9 length of upper glume, membranous, light brown, 1-keeled, 3 -veined. Lower glume primary vein scabrous. Lower glume surface glabrous. Upper glume ovate, 4.2–4.8 mm long, membranous, light brown, 1-keeled, 5 -veined. Upper glume primary vein scabrous. Upper glume surface glabrous.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 4.2 mm long, membranous, 1-keeled, 5 -veined. Fertile lemma ovate, 2.4 mm long, coriaceous, without keel. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 3.5 mm long overall, with twisted column.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Yunnan.

Arundinella mesophylla Nees ex Steud. *Syn. Pl. Gram.* 115 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: India, Madras: *Wallich 8663B ex Herb. Wight* (K holotype).

Illustrations (Books): K.M.Matthew, *Flora Palni Hills Supplement* (1998).

Derivation (Clifford & Bostock 2007): *Gk mesos*, middle; *L. phyllon*, leaf.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, slender, 20–45 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface or pilose, with tubercle-based hairs. Ligule a ciliolate membrane, 1 mm long. Leaf-blades 5–10 cm long, 4–6 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs. Leaf-blade margins scaberulous, tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, elliptic or ovate, 4–12 cm long, 2 cm wide, contracted about primary branches. Primary panicle branches 0.5–1.8 cm long. Panicle axis glabrous or villous. Panicle branches glabrous or villous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 4 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex setaceously acuminate. Upper glume lanceolate, 5.5 mm long, 2.75 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, with tubercle-based hairs. Upper glume apex entire or dentate, 2 -fid, acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 2.5 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma oblong, 2 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with twisted column. Column of lemma awn 3 mm long. Lateral lemma awns present, arising on apex of lobes, 2.5 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.5–1.75 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$n = 8$ (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. **Indian Subcontinent.** India.

Kerala. Tamilnadu.

Arundinella metzii Hochst. ex Miq. *Verh. Nederl. Inst.* 3, 4: 31 (1851).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

TYPE from India. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: India, Mangalore: *Hohenacker 297* (K iso).

Illustrations (Books): G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 12).

Derivation (Clifford & Bostock 2007): in honor of Fr. Metz (1819–1885) who collected in India.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, slender, 10–100 cm long. Culm-internodes smooth or scaberulous. Culm-nodes glabrous or pubescent. Lateral branches lacking. Leaf-sheaths hispid, with tubercle-based hairs, outer margin hairy. Ligule an eciliate membrane. Leaf-blades 10–40 cm long, 3–9 mm wide. Leaf-blade surface pilose, hairy on both sides. Leaf-blade margins scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous or pilose above. Panicle open, oblong, 20–50 cm long, 10–25 cm wide, contracted about primary branches. Primary panicle branches 5–15 cm long. Panicle axis scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 2–2.5 mm long, 0.5–0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume lateral veins prominent. Lower glume surface asperulous, rough on veins, glabrous or pilose, hairy between veins, with tubercle-based hairs. Lower glume margins eciliate or ciliate. Lower glume apex acute. Upper glume elliptic, 2.75–4.25 mm long, 2.5–4 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface glabrous or pilose, hairy between veins, with tubercle-based hairs. Upper glume margins eciliate or ciliate. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 1.75–2.5 mm long, 1 length of spikelet, membranous, 1-keeled, 3 -veined, acute. Fertile lemma elliptic or oblong, 1 mm long, coriaceous, without keel. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 3 mm long overall, with twisted column. Column of lemma awn 1–2 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.6–1 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). **Continent.** Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. India, Sri Lanka.
Kerala. Maharashtra, Tamilnadu.

Arundinella montana S. T. Blake. *Univ. Queensl. Papers, Dept. Biol.*, 1 No. 18, 16 (1941).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland:

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Moreton Dist., Mt. Ngungun, in rock crevices, 300–700 ft one of the abundant plants on the upper part of the mountain, *Blake 14143*.

Illustrations: None found.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. mons*, mountain; *-ana*, indicating location. Growing on mountains.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms 30–90 cm long, 5–13 -noded. Leaf-sheaths glabrous on surface or pilose, outer margin glabrous or hairy. Ligule a ciliolate membrane, 0.5–0.7 mm long, truncate. Leaf-blades involute, 5–19 cm long, 2–8 mm wide, stiff. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, linear or lanceolate, 8–23 cm long, 1–3 cm wide, contracted about primary branches. Primary panicle branches appressed, 1–7 cm long, bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches secund. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, 0.3–3 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–5.2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse. Floret callus hairs 1 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, shiny, gaping. Lower glume ovate, 3.3–4.7 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–7 -veined. Lower glume primary vein scaberulous. Lower glume apex acuminate, awned, 1 -awned, awn 1.1 mm long. Upper glume lanceolate, 1.4–1.7 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5–7 -veined. Upper glume primary vein scaberulous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 3.4–4.5 mm long, membranous, 1-keeled, 5 -veined, obtuse. Fertile lemma elliptic, 2.75–3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels, ciliolate. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 3.8–6 mm long overall, with twisted column. Column of lemma awn 1–2 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.7–2 mm long. Stigmas 2. Caryopsis with adherent pericarp, ellipsoid or oblong, 1.4 mm long. Hilum punctiform.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.
South East.

Arundinella nepalensis Trin. *Sp. Gram.* t. 268. (1826).

(Pl. 12).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Nepal.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms erect, 60–80 cm long, 1.5–5 mm diam. Culm-nodes pubescent. Leaves cauline. Ligule an eciliate membrane, 1 mm long, truncate. Leaf-blades 8–30 cm long, 3–10 mm wide, coriaceous, stiff. Leaf-blade surface glabrous or pilose. Leaf-blade apex obtuse, hardened.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate, 10–40 cm long, contracted about primary branches. Panicle branches angular, scaberulous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, filiform, angular.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 4–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse. Floret callus hairs 0.2–0.3 length of lemma.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 3–5 mm long, 0.6–0.9 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acute or acuminate or setaceously acuminate. Upper glume ovate, 1.5–2 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume primary vein scabrous. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 1.3 length of fertile lemma, membranous, 1-keeled, 5 -veined, acute. Fertile lemma ovate, dorsally compressed, lanceolate in profile, 2–2.5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4–6 mm long overall, with twisted column. Palea lanceolate, with auriculate flaps, 1 length of lemma, coriaceous, 2 -veined. Palea surface asperulous. Palea apex dentate, 2 -fid.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.7 mm long. Stigmas 2, protandrous, laterally exserted. Caryopsis with adherent pericarp, oblong. Hilum punctiform. Endosperm farinose.

Arundinella nervosa (Roxb.) Nees ex Hook. & Arn. *Bot. Beech. Voy.* 237 (1836).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Basionym or Replaced Name: *Holcus nervosus* Roxb., *Fl. Ind.* 1 : 320 (1820).

Illustrations (Books): K.M.Matthew, *Flora Palni Hills Supplement* (1998).

Derivation (Clifford & Bostock 2007): *L. nervus*, nerve; *-osa*, abundance. With conspicuous nerves in the glumes or lemmas.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms 15–80 cm long, without nodal roots or rooting from lower nodes. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface to pubescent. Ligule an eciliate membrane. Leaf-blades 12–24 cm long, 3–7 mm wide. Leaf-blade surface glabrous to pilose, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, elliptic or ovate, 6–25 cm long, contracted about primary branches. Panicle axis scabrous. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, bearing a few hairs, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 3.5 mm long, 0.6 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins, glabrous or pilose, hairy on veins. Lower glume apex setaceously acuminate. Upper glume elliptic, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, glabrous or pilose, hairy on veins, with tubercle-based hairs. Upper glume apex caudate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 3.5 mm long, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma oblong, 2.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 5–9 mm long overall, with twisted column. Column of lemma awn 2–4 mm long. Lateral lemma awns present, arising on apex of lobes, 2 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.2–1.4 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Meghalaya. Kerala, Karnataka. Maharashtra, Tamilnadu.

Arundinella nodosa B.S. Sun & Z.H. Hu. *Acta Bot. Yunnanica* 2(3): 327 (1980).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 789).

Derivation (Clifford & Bostock 2007): *L. nodus*, knot; *-osa*, abundance. Culm nodes swollen.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–45 cm long, 0.8–1.2(–1.5) mm diam., 7–13 -noded. Culm-internodes distally glabrous. Culm-nodes brown, glabrous. Leaf-sheaths hispid, with tubercle-based hairs, outer margin glabrous. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades linear, 4–6 cm long, 1 mm wide. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 4–6 cm long. Panicle branches angular, scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, 0.5–2.5 mm long, ciliate, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 4.5–4.9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.7 mm long, 0.33 length of lemma.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface hispid. Lower glume hairs white. Lower glume apex acuminate. Upper glume lanceolate or ovate, 4.5–4.9 mm long, membranous, 1-keeled, 5 -veined. Upper glume surface hispid. Upper glume hairs white. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3.2 mm long, membranous, 1-keeled, 5 -veined, obtuse. Palea of lower sterile floret membranous, 2 mm long. Fertile lemma lanceolate, 2 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 3 -awned. Principal lemma awn geniculate, 6 mm long overall, with twisted column. Column of lemma awn 2.5 mm long. Lateral lemma awns present, 1.5–1.7 mm long. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Yunnan.

Arundinella palmeri Vasey ex Beal. *Grasses N. Ant.* 2: 76 (1896).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Edward Palmer (1831–1911) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms 100–180 cm long, 2–3 mm diam. Ligule an eciliate membrane. Leaf-blades flat or involute, 10–30 cm long, 5–10 mm wide.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate or oblong, 20–35 cm long, contracted about primary branches. Primary panicle branches 10–20 cm long. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5–4 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3.5–4 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma lanceolate, 1.8–2.3 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4.5–7 mm long overall, with twisted column. Column of lemma awn 1.3–2 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Central Mexico, Northeast Mexico, Gulf (Mexico), Northwest Mexico, Southwest Mexico.

Mexico State. Durango. Veracruz. Sonora. Guerrero, Jalisco, Nayarit.

Arundinella parviflora B.S. Sun & Z.H. Hu. *Acta Bot. Yunnanica* 2(3): 319 (1980).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 793).

Derivation (Clifford & Bostock 2007): *L. parvus*, small; *flos*, flower. Spikelets small or with few florets.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect, 60–120(–200) cm long, 2–4 mm diam. Culm-internodes distally glabrous. Culm-nodes pubescent. Lateral branches sparse. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane. Leaf-blades linear or lanceolate, 17–25 cm long, 8 mm wide. Leaf-blade surface pilose, with tubercle-based hairs. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 16–32 cm long, 2–4 cm wide. Panicle axis scaberulous. Panicle branches angular, scaberulous, glabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, 1–3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 2–2.5(–2.7) mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.6 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 1.9–2.7 mm long, 0.75–1 length of upper glume, membranous, purple, 1-keeled, 3–5 -veined. Lower glume apex acuminate. Upper glume ovate, 2–2.5(–2.7) mm long, membranous, purple, 1-keeled, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 2.2–2.6 mm long, chartaceous, 1-keeled, 5 -veined, acute, mucronate. Fertile lemma lanceolate, 1.1–1.8 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 2.4–2.9 mm long overall, with twisted column, limb scaberulous. Column of lemma awn 0.7–1.1 mm long. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.

Yunnan.

Arundinella pilaxilis B.S. Sun & Z.H. Hu. *Acta Bot. Yunnanica* 2(3): 324 (1980).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pilus*, a hair; *axilis*, arm-pit. Lower axils of inflorescence densely hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, (150–)200–250 cm long, (2–)4–6 mm diam. Culm-internodes distally pubescent or pilose. Culm-nodes pubescent. Leaf-sheaths hispid, with tubercle-based hairs. Ligule a ciliolate membrane. Leaf-blades linear or lanceolate, 28–52 cm long, 8–10 mm wide. Leaf-blade surface pilose, densely hairy, hairy on both sides, with tubercle-based hairs.

Inflorescence. Inflorescence a panicle. Peduncle hispid above. Panicle open, oblong, 30–58 cm long, 4–5 cm wide. Primary panicle branches whorled at most nodes, 10–20 cm long. Panicle axis angular, scabrous, pilose. Panicle branches angular, scabrous, pilose. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present, 1–4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse. Floret callus hairs 0.5–0.9 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 3–3.5 mm long, 0.8–1 length of upper glume, membranous, purple, 1-keeled, 3–5(–7) -veined. Lower glume primary vein scabrous. Lower glume surface glabrous or pilose, hairy above. Lower glume apex acuminate. Upper glume ovate, 3.5–4 mm long, membranous, purple, 1-keeled, 5 -veined. Upper glume primary vein scabrous. Upper glume surface glabrous or pilose, hairy above. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3–3.5 mm long, membranous, 1-keeled, 3–5 -veined, obscurely veined, acute. Fertile lemma lanceolate, 1.9–2.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 3.2–3.5 mm long overall, with twisted column. Column of lemma awn 1–1.3 mm long. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, purple. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Temperate Asia.

Country /Province /State. China. China South Central. Yunnan.

Arundinella pubescens Merrill & Hackel. Philipp. Journ. Sci. 2: 419 (1907).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), T.Koyama, *Grasses of Japan and its neighboring regions* (1987).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Philippine Is., Palawan, Iwahig: *Foxworthy* 856 .

Illustrations (Books): C-C Hsu, *Flora of Taiwan*, Vol 5 (1978) (460), C-C Hsu, *Taiwan Grasses* (1975).

Derivation (Clifford & Bostock 2007): *L. pubesco*, become hairy. Plant whole or in part hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 20–35 cm long, 0.8–1 mm diam., 4–6 -noded. Culm-internodes distally hirsute. Culm-nodes pubescent. Leaves mostly basal. Leaf-sheaths 2–6 cm long, hirsute. Ligule a ciliolate membrane. Leaf-blades 3–10 cm long, 4–6 mm wide, stiff. Leaf-blade surface hirsute, hairy on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, lanceolate or oblong, 12–25 cm long, 1.5–3 cm wide. Primary panicle branches 1.5–4 cm long. Panicle axis glabrous or pubescent. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, recurved at apex. Lower glume lanceolate or ovate, 2.3–2.5 mm long, 0.66 length of upper glume, chartaceous, 1-keeled, 5 -veined. Lower glume primary vein scabrous. Lower glume apex acute. Upper glume lanceolate or ovate, 2.5 length of adjacent fertile lemma, 1 length of spikelet, chartaceous, 1-keeled, 5 -veined. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate or ovate, 3 mm long, chartaceous, 1-keeled, 3 -veined, acute. Fertile lemma lanceolate, 2–2.2 mm long, chartaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 4.5–5 mm long overall, with twisted column. Palea with auriculate flaps, chartaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China, Eastern Asia. Taiwan. **Malesia, Papuaasia.** Lesser Sunda Is, Philippines. New Guinea West Papua (Irian Jaya). New Guinea.

Arundinella pulchra ms Veldk. Fm ms.

Accepted by: J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. beautiful. Attractive in appearance, usually the inflorescence.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. **Malesia.** Philippines, Sulawesi.

Arundinella pumila (Hochst. ex A.Rich.) Steud. *Syn. Pl. Gram.* 114 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

TYPE from Ethiopia. **Basionym or Replaced Name:** *Acratherum pumilum* Hochst. et A. Rich., *Tent. Fl. Abyss.* 2: 414 (1850).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995) (285, Fig. 114), K.M.Mathew, Further Illustrations on the *Flora of Tamilnadu Carnatic* (1988) (Pl. 718), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Fig. 209).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, Grasses of Maharashtra (2012) (Pl. 12).

Derivation (Clifford & Bostock 2007): L. dwarf, low growing. Habit typically depauperate.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 7–50 cm long, 1–3-noded. Culm-nodes pubescent. Leaf-sheaths outer margin hairy. Ligule an eciliate membrane. Leaf-blades lanceolate, 3–15 cm long, 6–18 mm wide, flaccid. Leaf-blade surface glabrous or pilose, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle open, obovate, effuse, 5–25 cm long, 2–18 cm wide. Primary panicle branches profusely divided. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 1.5–8 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 1.5–2.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 1–1.5 mm long, 0.5–0.75 length of upper glume, membranous, 1-keeled, 3-veined. Lower glume apex acute or acuminate. Upper glume ovate, 1.5–2.5 mm long, 1.5–2.5 length of adjacent fertile lemma, membranous, 1-keeled, 3–5-veined. Upper glume surface glabrous or pilose. Upper glume apex acute or acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 1.3 length of fertile lemma, membranous, 1-keeled, 3-veined, truncate or obtuse. Fertile lemma ovate, 1 mm long, coriaceous, without keel, 1-veined, more than 3-veined, one-veined. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2-fid, awned, 1-awned. Principal lemma awn from a sinus, geniculate, 2–3 mm long overall, with twisted column. Column of lemma awn 1–1.5 mm long. Palea with auriculate flaps, 1 length of lemma, coriaceous, 2-veined. Palea surface asperulous.

Flower and Fruit. Anthers 3, 0.3 mm long. Caryopsis with adherent pericarp, 1 mm long.
n = 12 (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia, Tropical Asia.

Country /Province /State. **West Tropical Africa, West-Central Tropical Africa, Northeast Tropical Africa.** Ghana, Guinea, Nigeria, Sierre Leone. Cameroon. Ethiopia (inc. Eritrea). **Arabian Peninsula.** Oman. **Indian Subcontinent, Indo-China, Malesia.** Assam, Bangladesh, India, Sri Lanka. Myanmar. Java, Lesser Sunda Is, Sulawesi.

Arundinella purpurea Hochst. ex Steud. *Syn. Pl. Gram.* 74 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Illustrations (Books): K.M.Matthew, *Flora Palni Hills Supplement* (1998), G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig. 210).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 12).

Derivation (Clifford & Bostock 2007): L. purple to reddish. Usually of purple spikelets.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Culms 40–85 cm long. Culm-nodes pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths pilose or hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blade base broadly rounded. Leaf-blades linear or lanceolate or oblong, 10–20 cm long, 5–10 mm wide. Leaf-blade surface pubescent, densely hairy, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle scaberulous above, pilose above. Panicle open, elliptic or ovate, dense, 4–20 cm long, contracted about primary branches. Panicle axis hispid. Panicle branches hispid. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume orbicular, 2.5–3 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins, glabrous. Lower glume apex acute. Upper glume elliptic, 3.5–4 mm long, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, oblong, 3–3.5 mm long, 1 length of spikelet, membranous, 1-keeled, 3 -veined, acute. Fertile lemma elliptic or oblong, 1.5 mm long, coriaceous, pallid, without keel. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 3 mm long overall, with twisted column. Column of lemma awn 1 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous, pubescent, hairy on back, hairy above.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.75–1.25 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

$n = 10$ (1 ref TROPICOS), or 20 (1 ref TROPICOS). $2n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent, Indo-China. India. Myanmar. Kerala, Karnataka. Tamilnadu.

Arundinella ravii Shaju & N.Mohanan. *Rheedea* 14(1–2): 47–49, f. 1 (2004).

TYPE from India. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: India: Kerala: Idukki District: Eravikulam National Park, ca. 1880 m, 8 Nov 2000, *Shaju 43700* (HT: TBGT; IT: CALI, MH).

Illustrations: None found.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual, caespitose. Culms slender, 15–20 cm long. Ligule an eciliate membrane. Leaf-blades 2–10 cm long, flaccid. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 1.5–2 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate or ovate, 1.5–2 mm long, 1 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or ovate, 1.5–2 mm long, membranous, 1-keeled, 1 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins absent. Upper glume apex acute.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 1–1.25 mm long, chartaceous, 1-keeled, 3 -veined, scaberulous, dentate, 2 -fid, mucronate. Palea of lower sterile floret 0.75 mm long. Fertile lemma lanceolate, 1.8 mm long, coriaceous, without keel. Lemma margins involute, interlocking with palea keels. Lemma apex lobed, 2 -fid, incised 0.5 of lemma length, setaceous acuminate, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 2.5 mm long overall, with twisted column. Column of lemma awn 1 mm long. Palea with auriculate flaps, 1 mm long, coriaceous, 2 -veined.

Flower and Fruit. Anthers 3, 0.25 mm long.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Kerala.

Arundinella rupestris A. Camus. *Bull. Mus. Hist. Nat. Paris* 25: 367 (1919).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

TYPE from China. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: China: *Cavalerie & Fortunat 2034*; Indochina, Tonkin: *Balansa 1694*; Indochina, Tonkin: *Balansa 4901*;

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rupes*, rock; *-estre*, place of growth; Growing amongst rocks.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Culms 35–70 cm long. Leaf-sheaths pubescent. Ligule a ciliolate membrane. Leaf-blades involute, 15–20 cm long, 2–6 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, linear or lanceolate, 3–15 cm long, 1.5–2 cm wide, contracted about primary branches. Primary panicle branches bearing spikelets almost to the base. Panicle axis scabrous. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, 0.8–4 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 3.5 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 5 -veined. Lower glume primary vein scaberulous. Lower glume apex acuminate. Upper glume ovate, 1.8 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3.5–4 mm long, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma oblong, 2–2.2 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 2–3 mm long overall, with twisted column. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China. China South Central, China Southeast. **Indo-China.** Thailand, Vietnam.
Guangxi, Hunan. Guizhou.

Arundinella setosa Trin. *Gram. Panic.* 63 (1826).

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *-osa*, abundance. Glumes and/or lemmas awned or attenuated.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Butt sheaths glabrous or woolly. Culms 50–100 cm long. Culm-nodes glabrous. Leaf-sheaths glabrous on surface or pilose. Ligule a ciliate membrane. Leaf-blades 10–25 cm long, 2–5 mm wide. Leaf-blade surface glabrous to hirsute. Leaf-blade margins glabrous or ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, oblong or ovate, nodding, 5–30 cm long, contracted about primary branches. Primary panicle branches 1–15 cm long. Panicle axis smooth or scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, scabrous, bearing a few hairs, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 3.5–5 mm long, 0.6–0.7 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins. Lower glume apex acuminate, awned, 1 -awned. Upper glume elliptic, 5.5–7 mm long, 2 length of adjacent fertile lemma, membranous, 1-keeled, 5 -veined. Upper glume surface scabrous, rough on veins. Upper glume apex caudate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 3–4.5 mm long, membranous, 1-keeled, 5 -veined, obtuse. Fertile lemma lanceolate, 2.5–3 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 5–9.5 mm long overall, with twisted column. Column of lemma awn 3.5 mm long. Lateral lemma awns present, arising on apex of lobes, 2–3.5 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.5 mm long. Stigmas 2. Caryopsis with adherent pericarp. Embryo 0.6 length of caryopsis. Hilum punctiform.

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Pl. 12).

Derivation (Clifford & Bostock 2007): *L. spica*, thorn; *-ata*, possessing; Inflorescence a spike or spicate panicle.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, slender, 15–30 cm long, rooting from lower nodes. Leaf-sheaths pilose, with tubercle-based hairs, outer margin hairy. Ligule a ciliolate membrane. Leaf-blades lanceolate, 2–4 cm long, 3–6 mm wide. Leaf-blade surface pilose, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acute.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle antrorsely scabrous above. Panicle spiciform, linear, 2–5 cm long, 0.75–1 cm wide. Panicle axis pubescent. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 5.5–6 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 2–3 mm long, 0.5 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex acuminate, awned, 1 -awned. Upper glume lanceolate, 5.5–6 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume surface scabrous, glabrous or pilose. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 2.5 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma oblong, 1 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5–6 mm long overall, with twisted column. Column of lemma awn 3 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 0.25 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India. Maharashtra.

Arundinella suniana S.M. Phillips & S.L. Chen. *Novon* 15(3): 468 (2005).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of B. S. Sun, Chinese agrostologist.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Culms 85 cm long, 3 mm diam. Culm-nodes pubescent. Leaf-sheaths smooth, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades 22 cm long, 2.5–3.5 mm wide. Leaf-blade surface scabrous, glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 10 cm long, 2.5 cm wide. Primary panicle branches 3.5 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary or in pairs. Fertile spikelets pedicelled, 1–2 in the cluster. Pedicels present, unequal, 0.5–3 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6.8–7.8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus obtuse.

Glumes. Glumes persistent, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 6 mm long, 0.8 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface setose, with tubercle-based hairs. Lower glume apex acuminate. Upper glume lanceolate, 7.3 mm long, membranous, 1-keeled, 5 -veined. Upper glume surface setose, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 6.5 mm long, membranous, 1-keeled, 3 -veined, obtuse. Fertile lemma elliptic or oblong, 3.8 mm long, coriaceous, without keel. Lemma surface pubescent, hairy above. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 6–6.3 mm long overall, with twisted column. Column of lemma awn 2 mm long. Lateral lemma awns present, arising on apex of lobes, 0.7–0.9 mm long. Palea with auriculate flaps, coriaceous, 2 -veined.

Flower and Fruit. Anthers 3, 2.5–2.7 mm long.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central. Yunnan.

Arundinella tenggarae ms Veldk. Fm ms.

Accepted by: J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Indonesia.

Derivation (Clifford & Bostock 2007): named after the province Nusa Tenggara, where it occurs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Lesser Sunda Is.

Arundinella thwaitesii Hook. f. *Fl. Brit. Ind.* 7: 77 (1896).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960).

T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Sri Lanka, Ambayanava district: *Thwaites CP 3782* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of George Henry Kendrick Thwaites (1812–1882) English-born botanist, sometime Superintendent Botanic Gardens, Paradeniya, Sri Lanka.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 43–70 cm long. Culm-nodes glabrous or pubescent. Lateral branches lacking. Ligule an ciliate membrane. Leaf-blades 10–20 cm long, 3–6 mm wide, stiff. Leaf-blade surface glabrous, hairless except near base. Leaf-blade margins glabrous or tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, elliptic, 9–18 cm long, 3–5 cm wide. Panicle axis smooth. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, laterally compressed, 3.25–3.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume orbicular, 2 mm long, 0.66 length of upper glume, membranous, purple, 1-keeled, 3 -veined. Lower glume surface asperulous, rough on veins. Lower glume apex obtuse. Upper glume elliptic or orbicular, 3 mm long, 1.3 length of adjacent fertile lemma, 1 length of spikelet, membranous, purple, 1-keeled, 5 -veined. Upper glume surface asperulous, rough on veins. Upper glume apex obtuse.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma elliptic or oblong, 2.25 mm long, coriaceous, pallid, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex entire, obtuse, muticous. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2.25 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Sri Lanka.

Arundinella tricholepis B.S. Sun & Z.H. Hu. *Acta Bot. Yunnanica* 2(3): 321 (1980).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *thrix*, hair; *lepis*, scale. Glumes or lemmas hairy.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, culms solitary. Rhizomes short, scaly. Culms erect, 115–120 cm long, 2–3 mm diam., 5–6 -noded, without nodal roots or rooting from lower nodes. Culm-internodes distally glabrous. Culm-nodes pubescent. Leaf-sheaths hispid, with tubercle-based hairs, outer margin hairy. Ligule a ciliolate membrane, scarious, truncate. Leaf-blades linear or lanceolate, 20–40 cm long, 8–15 mm wide, herbaceous or coriaceous. Leaf-blade surface pilose, hairy on both sides, with tubercle-based hairs.

Inflorescence. Inflorescence a panicle. Peduncle glabrous. Panicle open, linear or oblong, 42 cm long, 3–5 cm wide. Primary panicle branches ascending, 7 cm long. Panicle axis scaberulous. Panicle branches angular. Spikelets solitary or in pairs. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 3.9–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pilose, obtuse. Floret callus hairs 0.5 mm long.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume ovate, 2.5–3.2 mm long, 0.75 length of upper glume, membranous, 1-keeled, 5 -veined. Lower glume primary vein scabrous. Lower glume surface pilose, with tubercle-based hairs. Lower glume apex acuminate. Upper glume ovate, 3.9–4 mm long, membranous, 1-keeled, 5–7 -veined. Upper glume primary vein scabrous. Upper glume surface pilose, with tubercle-based hairs. Upper glume apex acute.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 2.5–3.2 mm long, chartaceous, 1-keeled, 5 -veined, acute. Palea of lower sterile floret 2.2 mm long. Fertile lemma ovate, 2–2.2 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 2.7–2.9 mm long overall, with twisted column. Column of lemma awn 0.9 mm long. Palea coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.3 mm long, purple. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central.
Yunnan.

Arundinella tuberculata Munro ex Lisboa. *Bombay Grasses*, 29 (1891).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

Illustrations (Books): G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012) (Fig.213).

Images: G.G.Potgar, C.B.Salunkhe & S.R.Yadav, *Grasses of Maharashtra* (2012)
(Pl. 12).

Derivation (Clifford & Bostock 2007): *L. tuberculus*, wart; *-ata*, possessing. Lemmas or glumes bearing wart-like projections.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Annual. Culms erect, 40–80 cm long. Culm-nodes bearded. Lateral branches lacking. Leaf-sheaths pilose, with tubercle-based hairs. Ligule a ciliolate membrane. Leaf-blades oblong, 6–12 cm long, 6–11 mm wide. Leaf-blade surface scaberulous, hispid, hairy on both sides, with tubercle-based hairs. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Panicle open, linear or lanceolate, dense or loose, 7–14 cm long, 1–3 cm wide. Panicle axis scabrous. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 8–9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume ovate, 5 mm long, 0.5–0.6 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume surface scabrous, rough on veins, pilose, hairy on veins, with tubercle-based hairs. Lower glume apex setaceously acuminate. Upper glume lanceolate, 3–3.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, hairy on veins, with tubercle-based hairs. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, lanceolate, 4.5 mm long, membranous, 1-keeled, 3 -veined, acute. Fertile lemma elliptic or oblong, 2.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn from a sinus, geniculate, 9 mm long overall, with twisted column. Column of lemma awn 4.5 mm long. Lateral lemma awns present, arising on apex of lobes, 1 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 2–3 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.
Madhya Pradesh, Maharashtra.

Arundinella vaginata Bor. *Journ. Ind. Bot. Soc.* 27: 66 (1948).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: : Based on *A. villosa* var. *heynei*.

Illustrations (Books): K.M.Matthew, *Flora Palni Hills Supplement* (1998).

Derivation (Clifford & Bostock 2007): *L. vagina*, sheath; *-ata*, possessing. Leaf-sheaths conspicuous.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Butt sheaths villous. Culms erect, 30–70 cm long. Culm-internodes distally hirsute. Culm-nodes bearded. Leaf-sheaths hirsute, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades involute or convolute, 20–40 cm long, 3–7 mm wide. Leaf-blade surface scaberulous, rough on both sides, hirsute, hairy on both sides, with tubercle-based hairs. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle hirsute above. Panicle contracted, linear, 15 cm long, contracted about primary branches. Primary panicle branches 3 cm long. Panicle axis villous. Panicle branches bearing congested spikelets, villous. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 6.5–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume elliptic, 6–6.5 mm long, 0.9–1 length of upper glume, membranous, 1-keeled, 5 -veined. Lower glume surface pilose, hairy on veins, with tubercle-based hairs. Lower glume apex acute, awned, 1 -awned. Upper glume elliptic, 6.5–7 mm long, 2 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5 -veined. Upper glume surface pilose, hairy on veins, with tubercle-based hairs. Upper glume apex caudate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 6 mm long, 1 length of spikelet, membranous, 1-keeled, 5 -veined, scabrous, rough at apex or on midvein, acute. Fertile lemma elliptic or oblong, 3.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 5.5 mm long overall, with twisted column. Column of lemma awn 3 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1.5–2.25 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. India.

Kerala. Tamilnadu.

Arundinella vietnamensis ms Veldk. FM ms.

Accepted by: J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. -ense, denoting origin. From Vietnam.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indo-China. Vietnam.

Arundinella villosa Arn. ex Steud. Syn. Pl. Gram. 115 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.L.Bor, *Grasses of Burma, Ceylon, India and Pakistan* (1960).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Sri Lanka: *Herb. Wight 2037* (K holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial. Rootstock evident. Butt sheaths woolly. Culms 30–60 cm long. Leaf-sheaths pilose, with tubercle-based hairs. Ligule an eciliate membrane. Leaf-blades flat or involute or convolute, 20–45 cm long, 2–5 mm wide. Leaf-blade surface glabrous or pilose, with tubercle-based hairs. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence a panicle, bearing juvenile spikelets at emergence. Peduncle glabrous or pubescent above. Panicle contracted, linear, 2–18 cm long, contracted about primary branches. Primary panicle branches 1–2.5 cm long. Panicle axis scabrous, pubescent. Panicle branches pilose. Spikelets in pairs. Fertile spikelets pedicelled, 2 in the cluster. Pedicels present, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, laterally compressed, 7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus pubescent, obtuse.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 5–6 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface pilose, with tubercle-based hairs. Lower glume hairs 2.5 mm long. Lower glume apex acuminate. Upper glume elliptic, 2.5 length of adjacent fertile lemma, 1 length of spikelet, membranous, 1-keeled, 5–7 -veined. Upper glume surface pilose, with tubercle-based hairs. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male or barren, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, elliptic, 5 mm long, membranous, 1-keeled, 5 -veined, acute. Fertile lemma oblong, 2.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 6 mm long overall, with twisted column. Column of lemma awn 2.5 mm long. Palea with auriculate flaps, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1–2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Indian Subcontinent. Assam, India, Sri Lanka.

Arundinella yunnanensis Keng ex B.S. Sun & Z.H. Hu. *Acta Bot. Yunnanica* 2(3): 326 (1980).

Accepted by: W.D. Clayton & K. Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 794).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Yunnan Province, China.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Arundinellinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–50 cm long, 1–5 mm diam., 4–7 -noded. Culm-internodes smooth, distally glabrous. Culm-nodes glabrous. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Ligule absent. Leaf-blades 3–10 cm long, 1–3 mm wide. Leaf-blade surface glabrous, hairless except near base.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 8–19 cm long. Primary panicle branches appressed, 2 -nate, 4–7.5 cm long. Panicle axis smooth or scaberulous, glabrous. Panicle branches scabrous. Spikelets in pairs. Fertile spikelets pedicelled. Pedicels present, 1–4 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 3.5–4 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus bearded, obtuse. Floret callus hairs 0.5 length of lemma.

Glumes. Glumes persistent, reaching apex of florets, thinner than fertile lemma. Lower glume ovate, 2.5–3.5 mm long, 0.75 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume primary vein smooth or scaberulous. Lower glume apex acuminate. Upper glume ovate, 3.5–4 mm long, membranous, glaucous or purple, 1-keeled, 5 -veined. Upper glume primary vein smooth or scaberulous. Upper glume apex acuminate.

Florets. Basal sterile florets 1, male, with palea, persisting on inflorescence. Lemma of lower sterile floret similar to upper glume, ovate, 3.5–4 mm long, membranous, glaucous or purple, 1-keeled, 5 -veined, obtuse. Fertile lemma lanceolate, 2.5–3 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma surface asperulous. Lemma margins involute, interlocking with palea keels. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 4 mm long overall, with twisted column. Palea 1 length of lemma, coriaceous, 2 -veined. Palea surface asperulous.

Flower and Fruit. Lodicules 2, cuneate, fleshy. Anthers 3, 1–2 mm long. Stigmas 2. Caryopsis with adherent pericarp. Hilum punctiform.

Distribution (TDWG). Continent. Temperate Asia.

Country /Province /State. China. China South Central, Tibet. Yunnan.

Arundo donaciformis (Loisel.) Hardion, Laurent, Verlaque & Vila, Bruno. *Taxon* 61 (6): 1222 (2012).

TYPE from France. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Frejus, *Pereymond s.n.* (AV; iso: MARS).

Illustrations: None found.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, reed-like, 200–600 cm long. Culm-internodes thin-walled. Culm-nodes pubescent. Leaves cauline. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane. Leaf-blades drooping, 20–80 cm long, 10–70 mm wide. Leaf-blade surface smooth, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 30–60 cm long. Primary panicle branches profusely divided. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1–2 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, hairy in a ring above, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets, similar to fertile lemma in texture. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface pilose. Lower glume apex acute. Upper glume lanceolate, 1.25 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume surface pilose. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6–12 mm long, membranous, without keel, 5–9 -veined, more than 3-veined. Lemma hairs 5–8 mm long. Lemma apex acute or acuminate, muticous or mucronate. Palea 0.5–0.7 length of lemma, 2 -veined. Palea keels ciliolate.

Flower and Fruit. Lodicules 2. Anthers 3, 2.5–3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, ovoid, 2 mm long. Embryo 1 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Europe.

Region. Southwestern Europe.

Country /Province /State. : France.

Arundo donax L. Sp. Pl. 81 (1753).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), J.F.Veldkamp, Poaceae ms (*Flora Malesiana*), N.L.Bor, Grasses of Burma, Ceylon, India and Pakistan (1960), T.G.Tutin et al, *Flora Europaea* 5 (1980), T.Koyama, *Grasses of Japan and its neighboring regions* (1987), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

(Pl. 12).

Derivation (Clifford & Bostock 2007): Gk *donax*, a type of reed in Classical literature, so called because the inflorescences move to and fro in the slightest breeze (Gk *doneo*, shake) and so the diaspores are easily dispersed by the wind.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, reed-like, 200–600 cm long. Culm-internodes thin-walled. Leaves cauline. Ligule a ciliolate membrane. Leaf-blades drooping, 20–80 cm long, 10–70 mm wide. Leaf-blade surface smooth. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 30–60 cm long. Primary panicle branches profusely divided. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–7 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pilose, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets, similar to fertile lemma in texture. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 1.25 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6–12 mm long, membranous, without keel, 5–9 -veined, more than 3-veined. Lemma surface villous, hairy below. Lemma hairs 5–8 mm long. Lemma apex acute or acuminate, muticous or mucronate. Palea 0.5–0.7 length of lemma, 2 -veined. Palea keels ciliolate.

Flower and Fruit. Lodicules 2. Anthers 3, 2.5–3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, ovoid, 2 mm long. Embryo 1 length of caryopsis. Hilum punctiform.

Images: R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Formosa, now Taiwan.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms erect or geniculately ascending, reed-like, 50–150 cm long, 2–6 mm diam. Culm-internodes thin-walled. Lateral branches ample. Leaves cauline. Leaf-sheaths longer than adjacent culm internode. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades lanceolate, 10–25 cm long, 5–15 mm wide. Leaf-blade surface smooth. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, lanceolate or elliptic, dense, 10–30 cm long, 3–10 cm wide. Primary panicle branches 2-nate, profusely divided, 5–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–2 mm long.

Fertile Spikelets. Spikelets comprising 2–5 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate or elliptic, laterally compressed, 6–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.5–0.7 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume lanceolate, 4–7 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 4–9 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 4–6 mm long, membranous, without keel, 5–7 -veined, more than 3-veined. Lemma surface villous, hairy below. Lemma hairs 3 mm long. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, 2–4.5 mm long overall. Palea 3–4 mm long, 0.6–0.8 length of lemma, 2 -veined.

Flower and Fruit. Lodicules 2. Anthers 3, 1.2–1.7 mm long. Ovary glabrous. Caryopsis with adherent pericarp, 2 mm long.

Distribution (TDWG). Continent. Temperate Asia, Tropical Asia.

Country /Province /State. China, Eastern Asia. Nansei-Shoto, Taiwan. **Malesia.** Philippines.

Arundo micrantha Lam. *Tableau Encyclopédique et Methodique ... Botanique* 1: 196 (1791).

TYPE from Africa. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *D. Desfontaines s.n.*; no date; Africa (P; IT: US-78865 (fragm. ex P)).

Illustrations: None found.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, reed-like, 200–600 cm long. Culm-internodes thin-walled. Culm-nodes glabrous. Leaves cauline. Leaf-sheaths glabrous on surface. Ligule a ciliolate membrane. Leaf-blades drooping, 20–80 cm long, 10–70 mm wide. Leaf-blade surface smooth, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 30–60 cm long. Primary panicle branches profusely divided. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1–2 fertile florets, with a barren rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, hairy in a ring above, obtuse.

Glumes. Glumes persistent, similar, reaching apex of florets, similar to fertile lemma in texture. Lower glume lanceolate, 1 length of upper glume, membranous, 1-keeled, 3–5 -veined. Lower glume surface glabrous. Lower glume apex acute. Upper glume lanceolate, 1.25 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume surface glabrous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6–12 mm long, membranous, without keel, 5–9 -veined, more than 3-veined. Lemma surface villous, hairy below. Lemma hairs 5–8 mm long. Lemma apex acute or acuminate, muticous or mucronate. Palea 0.5–0.7 length of lemma, 2 -veined. Palea keels ciliolate.

Flower and Fruit. Lodicules 2. Anthers 3, 2.5–3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, ovoid, 2 mm long. Embryo 1 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Algeria.

Arundo plinii Turra. *Farset.* 11 (1765).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Italy. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Italy: Coll?.

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 352).

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): in honor of Gaius Plinius Secundus (23–79 PE) Roman Admiral and Natural Historian.

Classification. Subfamily Arundinoideae. Tribe: Arundineae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, reed-like, 100–200 cm long. Culm-internodes thin-walled. Lateral branches lacking. Leaves cauline. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades 15–60 cm long, 5–30 mm wide. Leaf-blade surface smooth. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 20–70 cm long. Primary panicle branches profusely divided. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, glabrous, obtuse.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume lanceolate, 7–9 mm long, 1 length of upper glume, membranous, 1-keeled, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–9 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 7–9 mm long, membranous, without keel, 5 -veined, more than 3-veined. Lemma surface villous, hairy below. Lemma hairs 4 mm long. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, 1.5–2.5 mm long overall. Palea 0.5–0.7 length of lemma, 2 -veined.

Flower and Fruit. Lodicules 2. Anthers 3. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southwestern Europe, Southeastern Europe.

Country /Province /State. : Balears, Corsica, France, Portugal, Sardinia, Spain. : Albania, Bulgaria, Italy, Crete, Sicily, Turkey Europe, Yugoslavia. **Northern Africa.** Algeria, Morocco, Tunisia. **Western Asia.** Lebanon-Syria, Turkey.

Arundoclaytonia dissimilis G. Davidse & R.P. Ellis. *Ann. Missouri Bot. Gard.*, 74(3): 479 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Aripuana R.: Calderon, Monteiro & Guedes 2706 (INPA holo, CANB, K).

Illustrations (Journals): *Ann. Missouri Bot. Gard.* (74: 483, Fig.7 (1987)).

Derivation (Clifford & Bostock 2007): L. different. Male and female inflorescences and spikelets dissimilar.

Classification. Subfamily Arundinoideae. Tribe: Arundineae. Tribe: Chasmanthieae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths absent. Culms erect, 200–300 cm long, firm or woody, with aerial roots from the nodes (lower part). Culm-internodes abbreviated and closely packed at the base, solid (lower part). Lateral branches sparse. Culm-sheaths absent. Leaves basal and cauline, spiral. Leaf-sheaths longer than adjacent culm internode (densely), glabrous on surface. Ligule a ciliate membrane, 0.9–2.1 mm long. Leaf-blades 45–80 cm long, 8–16 mm wide. Leaf-blade midrib indistinct. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex hooded. Monoecious, with male and female spikelets in the same inflorescence.

Inflorescence. Synflorescence compound, paniculate.

Inflorescence comprising only a few spikelets, comprising 7–20 fertile spikelets, terminal and axillary, subtended by a spatheole. Sexes segregated, with male above. Spikelets clustered at each node. Fertile spikelets sessile and pedicelled. Male spikelets sessile and pedicelled. Pedicels absent or present, 0.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, curved (slightly), dorsally compressed, 7–19 mm long, falling entire.

Glumes. Glumes dissimilar, shorter than spikelet. Lower glume ovate, 1.5–2 mm long, 0.6–0.7 length of upper glume, herbaceous, 1-keeled, 1–3 -veined. Lower glume apex acute. Upper glume ovate, 2.2–3.5

mm long, 0.4 length of adjacent fertile lemma, herbaceous, without keels, 3–5 -veined. Upper glume lateral veins without cross-veins or with cross-veins. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 3–5.1 mm long, 0.3–0.4 length of spikelet, herbaceous, 7–9 -veined, acute. Fertile florets female. Fertile lemma ovate, 5.7–8 mm long, herbaceous, keeled, 9–11 -veined, more than 3-veined. Lemma lateral veins prominent. Lemma surface pilose, hairy below (at base). Lemma hairs 1–1.5 mm long. Lemma apex acute. Palea lanceolate, tightly convolute around flower, falcate, 1.3–2.1 length of lemma, spongy (lower part), 9–13 -veined. Palea keels approximate (resulting in a shallow groove). Apical sterile florets distinct from fertile, 1 in number, barren, linear to lanceolate, 0.1–4 mm long.

Flower and Fruit. Lodicules absent. Anthers 2, 2.2–2.9 mm long. Filaments free. Stigmas 2. Caryopsis fusiform, 6–7 mm long. Embryo 0.3–0.4 length of caryopsis. Hilum elliptic.

Male spikelets distinct from female, 3–9 flowered, without rhachilla extension or with rudimentary apical florets, elliptic or oblong, 3.5–7.5 mm long. Male spikelet glumes 2. Male spikelet lemma 3–9 -veined.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil North. Amazonas.

Arundoclaytonia jauensis Davidse & Vincent. *Novon.*

Illustrations: None found.

Classification. Subfamily Arundinoideae. Tribe: Arundineae. Tribe: Chasmanthieae.

Distribution (TDWG). Continent. South America.

Asthenochloa tenera Bse. *Miq. Pl. Jungh.* 368 (1854).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, J.F.Veldkamp, Poaceae ms (*Flora Malesiana*).

TYPE from Java. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Java, Pidjungan: *Junghuhn*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. thin. Culms slender.

Classification. Subfamily Panicoideae. Tribe: Sacchareae. Subtribe Sorghinae.

Habit, Vegetative Morphology. Annual. Culms prostrate, 10–90 cm long, rooting from lower nodes. Ligule an eciliate membrane. Leaf-blades 3–15 cm long, 2–10 mm wide, flaccid.

Inflorescence. Inflorescence a panicle with branches tipped by a raceme. Panicle open, oblong, 4–7 cm long. Primary panicle branches spreading. Panicle branches capillary, terete. Racemes bearing a triad of spikelets. Rhachis obsolete. Raceme-bases filiform, pubescent, hairy at tip. Spikelets in threes. Fertile spikelets sessile, 1 in the cluster. Companion sterile spikelets pedicelled, 2 in the cluster. Pedicels present, oblong, flattened, 0.3 mm long, 0.15 length of fertile spikelet, plumose.

Sterile Spikelets. Companion sterile spikelets represented by barren pedicels.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, laterally compressed, 2 mm long, falling entire, deciduous with accessory branch structures. Spikelet callus bearded, base obtuse. Spikelet callus hairs 0.5 length of spikelet.

Glumes. Glumes dissimilar, exceeding apex of florets, firmer than fertile lemma. Lower glume ovate, 1 length of spikelet, cartilaginous, without keels, 5 -veined. Lower glume margins ciliolate. Lower glume apex dentate, 2 -fid. Upper glume oblong, cartilaginous, 3 -veined. Upper glume surface pubescent, hairy above. Upper glume apex acute, mucronate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret oblong, hyaline. Fertile lemma oblong, 1 mm long, hyaline, without keel, 1 -veined, 0–3 -veined, one-veined. Lemma apex lobed, 2 -fid, incised 0.4 of lemma length, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, 6–8 mm long overall, with twisted column. Column of lemma awn glabrous. Palea absent or minute.

Flower and Fruit. Lodicules absent. Anthers 2.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia. Java, Lesser Sunda Is, Sulawesi, Philippines.

Astrebula elymoides F. Muell. ex F. M. Bailey. *Grass. Queensl.* 1 (1879).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland. **Basionym or Replaced Name:** *Astrebula pectinata* var. *elymoides* F. Muell. ex F.M.Bailey, *Bot Bull. Dept. Agric. Queensland* 13: 15 (1896). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: from North Queensland and from meeting with it the Warrego in 1876 during the long drought' holo: not designated.

Illustrations (Books): C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (203, Pl. 60), J.R.Wheeler et al, *Flora of the Kimberley Region* (1992) (1125, Fig. 324), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (136), K.O.Mallett (ed.), *Flora of Australia*, Vol 44B. *Poaceae* (2004) (455, Fig. 81), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);, K.Domin, *Bibliotheca Botanica* 85 (1915) (375, Fig. 88).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, similar to. Resembling *Elymus* with respect to the inflorescence.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths glabrous. Culms erect or geniculately ascending, 80–120 cm long, 4–5 -noded. Leaf-sheaths keeled. Ligule a fringe of hairs. Leaf-blades 12–35 cm long, 3–5 mm wide, glaucous. Leaf-blade surface ribbed. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, straight or arcuate, unilateral, 12–35 cm long, 2–3 mm wide. Rhachis flattened, 1–1.5 mm wide. Spikelet packing broadside to rhachis, lax, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 1–2 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets elliptic, subterete, 10–20 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Rhachilla internodes 2–4 mm long. Floret callus pubescent.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume linear or lanceolate, 5–12 mm long, 0.5–0.7 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 11–17 mm long, 1 length of adjacent fertile lemma, membranous, without keels, 7–11 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 10–15 mm long, coriaceous, much thinner above, without keel, 3 -veined (in the body), 0–3 -veined. Lemma lateral veins augmented by subsidiaries in lobes. Lemma surface pubescent, hairy at base. Lemma apex lobed, 3 -fid, with simple equal lobes, with linear lobes, incised 0.25–0.8 of lemma length, awned, 1 -awned. Principal lemma awn 6–12 mm long overall. Palea 8 mm long. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, truncate. Anthers 3. Caryopsis with adherent pericarp, oblong, 4–6 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland, Western Australia.

Ereman. Victoria R & Barkly Tableland, Central Australia. North, Central, South East, Inland. Western Slopes, Western Plains.

Derivation (Clifford & Bostock 2007): *L. lappa*, burr; *-acea*, indicating resemblance. Lemmas shortly awned and overlapping.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms erect or decumbent, 30–80 cm long. Ligule a fringe of hairs. Leaf-blades 10–20 cm long, 4–5 mm wide, glaucous.

Inflorescence. Inflorescence composed of racemes. Racemes 1–2, single or paired, straight or arcuate, unilateral, 5–30 cm long. Rhachis flattened. Spikelet packing broadside to rhachis, lax, 1 their length apart, regular, 2-rowed. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 7–13 mm long, breaking up at maturity, disarticulating above glumes but not between florets.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 0.66 length of upper glume, scarious, 1-keeled, 1–5 -veined. Lower glume apex acute. Upper glume ovate, 7–13 mm long, 1.2 length of adjacent fertile lemma, scarious, without keels, 7–13 -veined. Upper glume apex acute.

Florets. Fertile lemma oblong, 6–10 mm long, coriaceous, much thinner above, without keel, 3 -veined (in the body), 0–3 -veined. Lemma lateral veins augmented by subsidiaries in lobes. Lemma surface pubescent. Lemma apex lobed, 3 -fid, with outer lobes longer, incised 0.5 of lemma length, awned, 1 -awned. Principal lemma awn 4–14 mm long overall. Palea keels pubescent. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 2 mm long.

Distribution (TDWG). **Continent.** Europe (*), Australasia.

Region. Northern Europe (*).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. pecten*, comb; *-ata*, possessing. Inflorescence with spikes or racemes bearing a fanciful resemblance to a comb.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Rhizomes short. Butt sheaths glabrous. Culms erect, 30–120 cm long, 6–9 -noded. Ligule a ciliolate membrane. Leaf-blades 7.5–25 cm long, 3–6 mm wide, glaucous. Leaf-blade surface ribbed. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Inflorescence composed of racemes, embraced at base by subtending leaf. Racemes 1, single, unilateral, 4–13 cm long, 10–20 mm wide. Rhachis flattened, puberulous on surface. Spikelet packing broadside to rhachis, crowded, regular, 2 -rowed. Spikelets pectinate, solitary. Fertile spikelets pedicelled. Pedicels present, oblong.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–17 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Rhachilla internodes 0.5 mm long. Floret callus pilose.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate or ovate, 7–14 mm long, 0.9–1 length of upper glume, chartaceous, much thinner on margins, 1-keeled, 5–9 -veined. Lower glume apex acuminate. Upper glume lanceolate or ovate, 8–13 mm long, 0.66–0.75 length of adjacent fertile lemma, chartaceous, with membranous margins, without keels, 7–16 -veined. Upper glume apex acuminate.

Florets. Fertile lemma oblong, 12–17 mm long, coriaceous, much thinner above, without keel, 3 -veined (in the body), 0–3 -veined. Lemma lateral veins augmented by subsidiaries in lobes. Lemma surface villous, hairy below. Lemma apex lobed, 3 -fid, with outer lobes longer, with lanceolate lobes, incised 0.5–0.7 of lemma length, awned, 1 -awned. Principal lemma awn 6 mm long overall. Palea 4–6 mm long. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, truncate. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Derivation (Clifford & Bostock 2007): L. spreading at right angles from a common axis. Inflorescence arms held at right angles to common axis.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 20–150 cm long. Ligule a fringe of hairs. Leaf-blades flat or conduplicate, 15–30 cm long, 3–6 mm wide. Leaf-blade surface scabrous, rough adaxially. Leaf-blade margins scaberulous. Leaf-blade apex filiform.

Inflorescence. Inflorescence composed of racemes, embraced at base by subtending leaf. Racemes 1, single, unilateral, 7–18 cm long. Rhachis flattened, scabrous on surface. Spikelet packing broadside to rhachis, regular, 2 -rowed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 1.5–2.5 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets ovate, laterally compressed, 8–11 mm long, breaking up at maturity, disarticulating above glumes but not between florets.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5–10 mm long, 0.8–0.9 length of upper glume, chartaceous, 1-keeled, 1–5 -veined. Lower glume apex acuminate, mucronate. Upper glume elliptic, 6–11 mm long, 1 length of adjacent fertile lemma, chartaceous, without keels, 9–11 -veined. Upper glume apex acuminate, mucronate.

Florets. Fertile lemma oblong, 9–12 mm long, coriaceous, much thinner above, without keel, 3 -veined (in the body), 0–3 -veined. Lemma lateral veins augmented by subsidiaries in lobes. Lemma surface villous, hairy below. Lemma apex lobed, 3 -fid, with outer lobes longer, incised 0.4–0.5 of lemma length, awned, 3 -awned. Principal lemma awn hooked, 5 mm long overall. Lateral lemma awns present, 3–4 mm long, shorter than principal. Palea 0.6–0.7 length of lemma. Palea keels ciliate. Palea apex lobed, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, truncate. Anthers 3, 2 mm long. Caryopsis with adherent pericarp, ellipsoid, dorsally compressed, 2.5–3 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, Northern Territory, Queensland, South Australia, Western Australia.

Kimberley. Darwin & Gulf, Victoria R & Barkly Tableland. NW & Lake Eyre. North, Central, South East. Western Plains.

Athroostachys capitata (Hook.) Benth. *Gen. Pl.* 3: 1209. 1883.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Merostachys capitata* Hook., *Icon. Pl.* 3: t. 273, 274 (1840)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *G. Gardner 136*, Brazil: Rio de Janeiro: common in low woods around Rio, flowers (K (2 sheets); ILT: BM, US-79094). LT designated by Clark, *Bamboo Sci. Cult.* 14(1): 1 (2000). ST: *Tweedie s.n.*, southern Brazil (K).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (20, Fig. 4), E.J.Judziwicz et al, *American Bamboos* (1999) (161, Fig. 72).

Illustrations (Journals): *Smithsonian Contributions to Botany* (9: 47, Fig. 19; 49, Fig. 20; (1973)).

Derivation (Clifford & Bostock 2007): L. caput, head; -ata, possessing. Inflorescence condensed to a sphere-like structure.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 300–800 cm long, 10–15 mm diam., woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Branch complement three, in a horizontal line, with subequal branches. Culm-sheaths present. Leaf-sheath oral hairs setose, spreading. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 8–40 cm long, 25–85 mm wide. Leaf-blade venation without cross veins.

Inflorescence. Synflorescence bractiferous, globose, with glumaceous subtending bracts, bracts 5 mm long, without axillary buds at base of spikelet.

Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 13–16 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 4–5 mm long, 1 length of upper glume, chartaceous, without keels, 7 -veined. Lower glume apex acute, awned, 1 -awned, awn 2–5 mm long. Upper glume ovate, 4–5 mm long, 0.3–0.4 length of adjacent fertile lemma, chartaceous, without keels, 7 -veined. Upper glume apex acute, awned, 1 -awned, awn 2–5 mm long.

Florets. Fertile lemma ovate, 13–16 mm long, coriaceous, keeled, 7 -veined, more than 3-veined. Lemma surface pubescent, hairy above. Lemma hairs red. Lemma apex acuminate. Palea 1 length of lemma. Palea keels ciliate. Apical sterile florets 1 in number, barren, lanceolate, 10 mm long.

Flower and Fruit. Lodicules 3, oblanceolate, membranous, ciliate. Anthers 3. Stigmas 2.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast, Brazil Southeast.

Mato Grosso, Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana. Mato Grosso. Bahia. Rio de Janeiro. Paraná.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Amazonas, Rio Marie: *Kubitzki, Calderon & Poppendiek 79–222* (INPA holo, B, CANB, COL, CTES, F, G, ISC, K, LE, MO, NY, P, PE, PRE, SI, SP, TULV, US, USCH, W, WIS).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (41, Fig. 21).

Illustrations (Journals): *Novon* (1:79, Fig.2 (1991)).

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Amazonas Province, Brazil.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose, clumped densely. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 600 cm long, 40–80 mm diam., woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement many, thinner than stem. Culm-sheaths present, deciduous but leaving a persistent girdle, 7–9 cm long, 4 times as long as wide, glabrous, glabrous on shoulders. Culm-sheath ligule 0.2–0.3 mm high. Culm-sheath blade triangular, as wide as sheath at base, demarcated but persistent, erect, 3–5 cm long, 14–16 mm wide, acute. Leaves 5–9 per branch. Leaf-sheaths keeled (above), glabrous on surface, outer margin hairy. Leaf-sheath oral hairs ciliate, 3–6 mm long, dark (brown). Ligule an eciliate membrane, 0.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.3 cm long, petiole glabrous. Leaf-blades lanceolate, 10–17 cm long, 10–14 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal. Peduncle 5–13 cm long. Racemes 1, single, 7–15 cm long, bearing 8–13 fertile spikelets on each. Rhachis glabrous on surface. Spikelets appressed or ascending. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or lanceolate, subterete, 20–28 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated between glumes and elongated below proximal fertile floret. Rhachilla elongation 1 mm long (between glumes) or 2–3.5 mm long (below floret).

Glumes. Glumes shorter than spikelet, thinner than fertile lemma. Lower glume elliptic, 4.5–5.5 mm long, membranous, without keels, keel-less throughout, 5 -veined. Lower glume apex awned, 1 -awned, awn 1.5–3.5 mm long. Upper glume lanceolate, 6–7 mm long, membranous, without keels, keel-less except near apex, 7 -veined. Upper glume mucronate or awned, 1 -awned, awn 1–3 mm long.

Florets. Fertile lemma lanceolate, subterete, 18–23 mm long, 1.2–2 mm wide, coriaceous, without keel, 7–11 -veined, more than 3-veined. Lemma margins convolute, covering most of palea, ciliolate. Lemma apex acuminate, pungent or awned, 1 -awned. Principal lemma awn 1–3 mm long overall. Palea tightly convolute around flower, coriaceous, 4 -veined. Palea keels approximate, ciliolate. Rhachilla extension 10–20 mm long. Apical sterile florets 1 in number, lanceolate, 1–1.5 mm long.

Flower and Fruit. Lodicules absent. Anthers 3, 4–10 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Venezuela. Colombia. Brazil West Central, Brazil North. Amazonas.

Atractantha aureolanata E.J. Judziewicz. *Ann. Missouri Bot. Gard.* 79(1): 166 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil, Belmonte: *Soderstrom, Russell & Hage 2148* (CEPEC holo, B, C, CANB, COL, F, G, ISC, K, LE, MO, NY, P, PE, PRE, SGO, SI, SP, US, W, WIS).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. aureus*, golden-yellow; *lana*, wool; *-ata*, possessing. Nodes with a skirt of golden woolly hairs.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 1000–2000 cm long, 5–20 mm diam., woody. Culm-internodes terete, solid, dark green or black, smooth, distally glabrous or pubescent. Culm-nodes glabrous. Lateral branches dendroid, intravaginal. Branch complement several, with 1 branch dominant, thinner than stem. Culm-sheaths present, persistent or deciduous but leaving a persistent girdle, 6–25 cm long, 4–5 times as long as wide, without basal lobes, glabrous, hairy on margins, auriculate, with 3 mm high auricles, setose on shoulders, shoulders with 5–15 mm long hairs. Culm-sheath ligule 0.5–1 mm high. Culm-sheath blade lanceolate, deciduous, reflexed, attenuate. Leaves 5–13 per branch. Leaf-sheaths pubescent. Leaf-sheath oral hairs setose, 2–12 mm long, pale. Leaf-sheath auricles absent or erect, 1–2 mm long. Ligule an eciliate membrane, 0.2–0.5 mm long. Leaf-blade base cuneate or broadly rounded, with a brief petiole-like connection to sheath, petiole 0.15–0.35 cm long, petiole glabrous or pubescent. Leaf-blades lanceolate, 9–17 cm long, 10–20 mm wide, light green and glaucous, discolorous with last colour beneath. Leaf-blade venation without cross veins. Leaf-blade surface glabrous or puberulous. Leaf-blade apex acute.

Inflorescence. Synflorescence bractiferous, fasciculate, 3–5 cm long, lax, with glumaceous subtending bracts and foliaceous subtending bracts, bracts 80–170 mm long, with axillary buds at base of spikelet, prophyllate below lateral spikelets.

Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 27–36 mm long, falling entire.

Glumes. Glumes both absent or obscure.

Florets. Fertile lemma lanceolate, subterete, 27–36 mm long, coriaceous, dark green or black, shiny, without keel, 11–15 -veined, more than 3-veined. Lemma surface smooth or scaberulous, with distinct germination flap, glabrous. Lemma margins convolute, covering most of palea. Lemma apex setaceously acuminate. Palea tightly convolute around flower, 1 length of lemma, chartaceous. Palea keels contiguous above a sulcus, eciliate or ciliolate. Palea apex lobed, 2 -fid (lobes 2–4 mm). Rhachilla extension 30 mm long.

Flower and Fruit. Lodicules 3, 4–5 mm long, membranous, ciliate. Anthers 3, 10–13 mm long, purple. Stigmas 2. Ovary pubescent on apex. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast. Bahia.

Atractantha cardinalis E.J. Judziewicz. *Ann. Missouri Bot. Gard.* 79(1): 170 (1992).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. cardo*, hinge; *-alis*, pertaining to. Chief or by transfer of meaning red. The secondary branchlets are subtended by reddish bracts.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose, clumped loosely. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, pendulous at the tip, 1000–1500 cm long, 5–13 mm diam., woody. Culm-internodes terete, solid, dark green or black, retrorsely scabrous, distally glabrous or pubescent. Culm-nodes glabrous. Lateral branches dendroid, intravaginal. Branch complement several, with 1 branch dominant, thinner than stem. Culm-sheaths present, persistent or deciduous but leaving a persistent girdle, 13–33 cm long, 10 times as long as wide, with basal lobes, antrorsely scabrous, glabrous, glabrous on margins, without auricles, setose on shoulders, shoulders with 5–10 mm long hairs. Culm-sheath ligule 1 mm high. Culm-sheath blade linear, deciduous, erect or spreading or reflexed, 3–13 cm long, 1–13 mm wide, attenuate. Leaves 5–13 per branch. Leaf-sheaths glabrous on surface or pubescent, outer margin hairy. Leaf-sheath oral hairs setose, 3–8 mm long, pale. Leaf-sheath auricles absent. Ligule an eciliate membrane, 0.2–0.5 mm long. Leaf-blade base cuneate or broadly rounded, with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole glabrous or pubescent. Leaf-blades linear or lanceolate, 6–11 cm long, 4–8 mm wide, dark green and light green, discolorous with last colour beneath. Leaf-blade venation without cross veins. Leaf-blade surface glabrous. Leaf-blade apex acute.

Inflorescence. Synflorescence bractiferous, paniculate, 3–6 cm long, lax, with glumaceous subtending bracts and foliaceous subtending bracts, bracts 70–200 mm long, with axillary buds at base of spikelet, prophyllate below lateral spikelets.

Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension or with a barren rhachilla extension or with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 29–35 mm long, falling entire.

Glumes. Glumes both absent or obscure.

Florets. Fertile lemma lanceolate, subterete, 29–35 mm long, 1.8–2.3 mm wide, coriaceous, without keel, more than 3-veined. Lemma surface with distinct germination flap, pubescent. Lemma margins convolute, covering most of palea. Palea tightly convolute around flower, chartaceous.

Flower and Fruit. Lodicules 3, membranous. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Bahia.

Aulonemia amplissima (Nees) McClure. *Smithsonian Contrib. Bot.* 9: 56 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria amplissima* Nees, *Linnaea* 9(4): 479 (1834)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n.*, no date, Brazil (B; IT: LE-TRIN-3160.01, US-1021434, US-2808846, US-1021433, US-557547).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. amplius*, large; *-issima*, most. Culms taller than many other species of the genus.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms 200 cm long, woody. Culm-internodes terete. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheaths striately veined. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or ovate, 15–20 cm long, 15–75 mm wide. Leaf-blade venation with 18–22 secondary veins, without cross veins. Leaf-blade surface scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, effuse, 45 cm long, 20–25 cm wide. Primary panicle branches spreading. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2–5 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, mucronate. Upper glume lanceolate, 5–6 mm long, membranous, without keels, 5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 5–7 mm long, chartaceous, without keel, 5–7 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma apex acute.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. $n = 20$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Minas Gerais, Rio de Janeiro, Sao Paulo. Paraná.

Illustrations (Journals): *Hoehnea* (40: 321, fig. 3 (2013)).

Derivation (Clifford & Bostock 2007): *L. arista*, bristle; *-ula*, diminutive; *-ata*, possessing. Lemma awned.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 60–300 cm long, woody. Culm-internodes terete, thin-walled. Culm-nodes without obvious supra-nodal ridge. Lateral branches suffrutescent. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, persistent. Leaf-sheaths pilose. Leaf-sheath oral hairs bearded. Ligule an eciliate membrane. Collar pubescent. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades spreading, lanceolate, 10–19 cm long, 12–23 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface scaberulous, rough adaxially, pubescent, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 15–45 cm long. Primary panicle branches spreading. Panicle branches angular, scabrous, with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, 12–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pubescent, hairy at tip.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 0.7–0.8 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex obtuse, muticous or awned, 1 -awned. Upper glume lanceolate, 0.3–0.4 length of adjacent fertile lemma, membranous, without keels, 5–7 -veined. Upper glume apex obtuse, muticous or awned, 1 -awned.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, elliptic, awned. Fertile lemma elliptic, 8 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 2–3 mm long overall. Palea 0.8–0.9 length of lemma. Palea keels ciliolate. Palea surface pubescent, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South.

TYPE from Colombia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Colombia, Paramo de Cruz Verde: *Cleef 2879* (COL holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Bogota, Colombia.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or decumbent or scandent, 30–110 cm long, 1–2.5 mm diam., woody. Culm-internodes terete, thin-walled, 4–10 cm long, distally glabrous. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, persistent, 2.4–6.2 cm long. Culm-sheath blade triangular, deciduous, reflexed, 0.6–3.4 cm long. Leaf-sheaths pubescent. Leaf-sheath oral hairs setose, 2–13 mm long, pale. Ligule an eciliate membrane, 0.5 mm long, pubescent on abaxial surface, truncate. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.05–0.15 cm long, petiole pubescent. Leaf-blades reflexed, lanceolate, 1.4–4.2 cm long, 2–5 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface pubescent, hairy abaxially. Leaf-blade margins cartilaginous, serrulate. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 4–14 cm long, 1–2 cm wide. Panicle axis angular, puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 1–12 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 3–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, subterete, 9.7–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1–2.3 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3.5–5.5 mm long, membranous, without keels, 3 -veined. Lower glume primary vein scabrous. Lower glume surface puberulous. Lower glume apex attenuate. Upper glume ovate, 4.8–6.8 mm long, membranous, without keels, 5–7 -veined. Upper glume surface pubescent, hairy above. Upper glume margins ciliate. Upper glume apex acute.

Florets. Fertile lemma ovate, 3.5–6 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface puberulous, hairy above. Lemma margins ciliate, hairy above. Lemma apex obtuse. Palea 2.5–5 mm long, 2–4 -veined. Palea keels ciliate, adorned above, with 0.5 of their length adorned. Palea surface puberulous, hairy on back and on flanks, hairy above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 0.5–0.9 mm long. Anthers 3, 0.8–2.8 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Aulonemia boliviana Renvoize. *Gr. Boliv.* 39 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Bolivia, Yolossa: *Renvoize 4779* (LPB, K).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (34, Fig. 3).

Derivation (Clifford & Bostock 2007): *L. -ana*, indicating location. From Bolivia.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning or scandent, 5 mm diam., woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths striately veined. Leaf-sheath oral hairs ciliate, erect, 1–3 mm long. Leaf-sheath auricles erect. Ligule an eciliate membrane. Leaf-blade base

asymmetrical, with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 10–19 cm long, 15–30 mm wide. Leaf-blade surface scabrous, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 20–26 cm long. Primary panicle branches spreading. Panicle branches glabrous, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 10–45 mm long.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 12–30 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 1–2 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume margins ciliate. Lower glume apex acute. Upper glume ovate, 3–4 mm long, membranous, without keels, 7 -veined. Upper glume margins ciliate. Upper glume apex acute.

Florets. Fertile lemma lanceolate or oblong, 6 mm long, herbaceous, purple, without keel, 7–9 -veined, more than 3-veined. Lemma margins ciliate, hairy above. Lemma apex acute. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Aulonemia bromoides Judz. & E. Shea. *J. Bot. Res. Inst. Texas* 4 (2): 570–573, f. 1–3D–F (2010).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: La Paz: Prov. Franz Tamayo: Senda Apolo-San Jose de Uchupiamonas, a media hora de 3 de Mayo, hacia Turnia, 14°3.654'S [-39.2°]. 68°0.076'W [04.6°], 1824 m [1740 m on Google Earth], hierba graminoide 2 m, tallo hueso, espigas verde plomizo, 22 Apr 2003 HT: LPB; IT: MO-4893775, MO-4893776

Illustrations (Journals): *J. Bot. Res. Inst. Texas* (4 (2) 571, Fig.1 (2010)).

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 159–200 cm long, 10–12 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Lateral branches dendroid. Culm-sheaths present, 3–18 cm long, glabrous, without auricles, glabrous on shoulders. Culm-sheath ligule 0–5 mm high. Culm-sheath blade lanceolate, erect, 0.25 cm long, 1.5 mm wide. Leaves 3 per branch. Leaf-sheaths striately veined, glabrous on surface or pubescent. Leaf-sheath oral hairs lacking. Leaf-sheath auricles absent. Ligule an eciliate membrane, 20–25 mm long. Collar with external ligule. Leaf-blade base cuneate or broadly rounded, with a brief petiole-like connection to sheath, petiole 0.4–0.6 cm long. Leaf-blades lanceolate or ovate, 18–25 cm long, 53–67 mm wide. Leaf-blade surface glabrous. Leaf-blade margins cartilaginous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, ovate, effuse, 25–35 cm long, 17–22 cm wide. Primary panicle branches ascending. Panicle branches capillary, scaberulous, glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 30–60 mm long.

Fertile Spikelets. Spikelets comprising 2 basal sterile florets, 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or oblong, laterally compressed, 40–43 mm long, 3–4.1 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes elongated below proximal fertile floret. Rhachilla elongation 1.9–2.2 mm long, pubescent.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2.7–4.4 mm long, 0.5–0.66 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume surface glabrous. Lower glume margins ciliolate. Lower glume apex acute. Upper glume lanceolate, 4.8–6.7 mm long, 0.5 length of adjacent fertile lemma, membranous, without keels, 5–7 -veined. Upper glume surface glabrous. Upper glume margins pubescent. Upper glume apex acute.

Florets. Basal sterile florets 2 or more, similar, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate, 6.1–10.1 mm long, membranous, 7–9 -veined, pubescent on margins, acute. Lemma of upper sterile floret lanceolate, 9–11 mm long, membranous, ciliolate on margins, acute. Fertile lemma lanceolate, 11.7–14.9 mm long, 2.5–2.8 mm wide, chartaceous, without keel, 9–11 -veined, more than 3-veined. Lemma margins ciliolate. Lemma apex

acute. Palea elliptic, 8.4–12.5 mm long, 1 length of lemma. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, lanceolate, 1.5 mm long, veined, ciliate, hairy across the apex. Anthers 3, 3.6–6.2 mm long, orange.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (43, Fig. 23).

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Maizo del Chimanta District, Venezuela.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 100–150 cm long, woody. Culm-internodes terete, smooth. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheath oral hairs setose, 10–20 mm long, dark. Ligule an eciliate membrane, 1 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.4–0.6 cm long. Leaf-blades lanceolate, 11–14 cm long, 15–35 mm wide. Leaf-blade surface scaberulous, rough abaxially, puberulous, hairy abaxially. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Peduncle 5–15 cm long, antrorsely scabrous above. Panicle open, ovate, 22–28 cm long. Primary panicle branches ascending, 6–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 9–15 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13–40 mm long, 1.8–2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2–3 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 1.5–1.7 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume ovate, 3–4.5 mm long, membranous, without keels, 3–5 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, developed, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret present, similar to upper glume, ovate, 4.5–6 mm long, purple, 3–5 -veined, acute. Fertile lemma ovate, (6–)8–10 mm long, 3–4 mm wide, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface glabrous or puberulous. Lemma margins ciliolate. Lemma apex obtuse. Palea 7–9 mm long. Palea keels ciliolate.

Flower and Fruit. Lodicules 3, 0.9–1 mm long, veined, ciliate. Anthers 3, 2.5–3.3 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Aulonemia cochabambensis Judz. & L.G. Clark. *Brittonia* 63(3): 376, f. 1 920110.

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Depto. Cochabamba: Prov. Carrasco, above Sehuencas, 17° 31.1'S, 65°6.6'W, 2350 m; 17 Feb 2000, B. Ståhl 5660, HT: LPB; IT: ISC, NY.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 100–120 cm long, 4 mm diam., woody. Culm-internodes terete, thick-walled, antrorsely scabrous, distally glabrous. Culm-nodes with distinct supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs ciliate, 2–4 mm long. Ligule a ciliolate membrane, 0.2–0.3 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.3 cm long, petiole glabrous. Leaf-blades linear or lanceolate, 10–13 cm long, 10–14 mm wide, dark green and glaucous, discolorous with last colour beneath. Leaf-blade surface puberulous, hairy abaxially. Leaf-blade margins cartilaginous, scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle, comprising 3–7 fertile spikelets, without bracts or bracteate at branch bases. Peduncle 7–12 cm long. Panicle open, ovate, effuse, 10–13 cm long, 5–7 cm wide. Panicle branches capillary, puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 20–30 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–55 mm long, 3–4.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two, persistent, similar, shorter than spikelet. Lower glume lanceolate, 7–10 mm long, membranous, 3 -veined. Lower glume surface puberulous. Lower glume margins ciliate. Lower glume apex awned, 1 -awned, awn 3–6 mm long. Upper glume linear, 10–13 mm long, membranous, without keels, 7–11 -veined. Upper glume surface puberulous. Upper glume margins ciliate. Upper glume awned, 1 -awned, awn 3–6 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret lanceolate, 12–16 mm long, 7–9 -veined, puberulous, ciliate on margins, awned. Awn of lower sterile floret 4–7 mm long. Fertile lemma lanceolate, 18–21 mm long, chartaceous, without keel, 7–9(–11) -veined, more than 3-veined. Lemma surface puberulous, hairy below. Lemma apex awned, 1 -awned. Principal lemma awn 5–9 mm long overall. Palea 10–15 mm long, 4 -veined, 2-keeled. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Derivation (Clifford & Bostock 2007): L. bent abruptly downwards. Inflorescence branches drooping.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 100–150 cm long, 4–5 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present. Leaf-sheaths keeled, striately veined, glabrous on surface, outer margin glabrous or hairy. Leaf-sheath oral hairs setose, 10–18 mm long. Ligule an eciliate membrane, 1 mm long, brown, erose, truncate. Collar with external ligule. Leaf-blade base cuneate or broadly rounded, symmetrical, with a brief petiole-like connection to sheath, petiole 0.3–0.4 cm long, petiole glabrous. Leaf-blades reflexed, deciduous at the ligule, lanceolate, 12–15 cm long, 22–28 mm wide. Leaf-blade midrib indistinct. Leaf-blade venation without cross veins. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle 10–30 cm long. Panicle open, pyramidal, effuse, 12.5–28 cm long, 2.5–5 cm wide. Primary panicle branches ascending, 10–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 6–60 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 11–13 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2–3 mm long, 0.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 4–5 mm long, 0.5–0.75 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1. Lemma of lower sterile floret lanceolate, 6–7 mm long, 5–7 -veined, obscurely veined. Fertile lemma lanceolate, 8–10 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma margins ciliolate. Lemma apex acute. Palea 8 mm long. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Guyana, Venezuela.
Roraima.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 40–80 cm long, 3–4 mm diam., woody. Culm-internodes terete, thick-walled, distally pruinose. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one. Culm-sheaths present. Leaves 4–5 per branch. Leaf-sheaths without keel, striately veined, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 0.4–0.6 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole glabrous. Leaf-blades reflexed, deciduous at the ligule, lanceolate, 7–10 cm long, 10–23 mm wide. Leaf-blade surface puberulous, hairy on both sides. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 20–25 cm long, 8–10 cm wide. Panicle branches capillary, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 8–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25–35 mm long, 1.5–2.7 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2–2.5 mm long, membranous, without keels, 1–3 -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 5–5.7 mm long, membranous, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 8–10 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex apiculate, mucronate. Palea 6.5–7.5 mm long, 2 -veined.

Flower and Fruit. Anthers 3, 3 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. spread out. Inflorescence an open panicle.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 150 cm long, 5 mm diam., woody. Culm-internodes terete, thin-walled. Culm-nodes without obvious supra-nodal ridge. Lateral branches suffrutescent. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, deciduous, setose on shoulders. Ligule an eciliate membrane, 0.5–1 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.4 cm long. Leaf-blades lanceolate, 10–15 cm long, 20–25 mm wide, mid-green or glaucous, discolourous with last colour beneath. Leaf-blade venation without cross veins. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, globose, effuse, 40 cm long. Primary panicle branches 1-nate, 20–30 cm long. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 20–30 mm long, 3 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes eventually visible between lemmas, scaberulous.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3 mm long, 0.5 length of upper glume, membranous, without keels, 1-veined. Lower glume lateral veins absent. Lower glume apex obtuse. Upper glume lanceolate, 6 mm long, 0.75 length of adjacent fertile lemma, membranous, without keels, 3-veined. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, lanceolate, 6 mm long, 5-veined, obtuse, mucronate. Fertile lemma elliptic, 7–8 mm long, chartaceous, without keel, 5–7-veined, more than 3-veined. Lemma surface scaberulous. Lemma apex acute, mucronate. Palea 1 length of lemma. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.5 mm long, ciliate. Anthers 3, 3 mm long. Stigmas 2.

Distribution (TDWG). Continent. South America.

Derivation (Clifford & Bostock 2007): L. *fimbriae*, fringe; *-ata*, possessing; *folium*, leaf.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or scandent, 150–400 cm long, 5–10 mm diam., woody. Culm-internodes terete, 30 cm long, distally glabrous. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid,

intravaginal. Bud complement 1. Branch complement one. Culm-sheaths present, 10–15 cm long, glabrous, setose on shoulders, shoulders with curved hairs, shoulders with 10–30 mm long hairs. Culm-sheath blade lanceolate, narrower than sheath, deciduous, reflexed, 6–12 cm long. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, flat, curly, 30–120 mm long, pale. Ligule a ciliate membrane. Collar with external ligule. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.2–0.3 cm long. Leaf-blades lanceolate, 17.5–30 cm long, 22–60 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade margins ciliate (fimbriate), hairy at base. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, 28–45 cm long. Primary panicle branches ascending. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 30–50 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes several, 3 empty glumes, persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 1.7–3.2 mm long, membranous, without keels. Lower glume apex mucronate or awned, 1 -awned, awn 2.2–3 mm long. Upper glume lanceolate, 5–7.5 mm long, membranous, without keels. Upper glume awned, 1 -awned, awn 2–2.3 mm long.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret lanceolate, 7.5–9 mm long, awned. Awn of lower sterile floret 1.2–3.6 mm long. Fertile lemma lanceolate, 6.5–9.5 mm long, chartaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma apex awned, 1 -awned. Principal lemma awn 2.4–5 mm long overall. Palea 5–7 mm long.

Flower and Fruit. Anthers 3, 3.5 mm long.

Distribution (TDWG). Continent. South America.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 200–250 cm long, 7 mm diam., woody. Culm-internodes terete, thin-walled, yellow and mid-green, mottled, striate, distally glabrous. Lateral branches dendroid. Leaf-sheaths striately veined, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, curly, 8–15 mm long, dark. Leaf-sheath auricles erect, 4–8 mm long. Ligule absent. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.3 cm long. Leaf-blades reflexed, ovate, 13–18 cm long, 47–57 mm wide. Leaf-blade surface glabrous. Leaf-blade margins cartilaginous, scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle 20 cm long, glabrous. Panicle open, ovate, effuse, 45 cm long, 30 cm wide. Primary panicle branches ascending. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 20–40 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 7–11 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 23–40 mm long, 4–5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2–3.5 mm long, membranous, without keels, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acute. Upper glume lanceolate, 3.5–5 mm long, membranous, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 6–7 mm long, 5–9 -veined, acute. Fertile lemma lanceolate, 8–9 mm long, herbaceous, without keel, 7–11 -veined, more than 3-veined. Lemma surface puberulous, hairy below. Lemma apex acute. Palea 8–9.5 mm long. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.3–1.5 mm long, veined, ciliate. Anthers 3. Stigmas 2.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

TYPE from Bolivia. **Basionym or Replaced Name:** *Arundinaria herzogiana* Henrard, *Meded. Rijks-Herb.* HT: *T. Herzog 2396*, Oct 1911, Bolivia: Río Saujana (L; IT: US). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Herzog 2396*, Oct 1911, Bolivia: Río Saujana (L; IT: US).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (40, Fig. 5).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Theodor Herzog (1880–1961) German botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 300–6700 cm long, 0.5–4 mm diam., woody. Culm-internodes alternately elongated and bunched, terete, thin-walled. Lateral branches dendroid. Branch complement many. Culm-sheaths present. Leaf-sheaths smooth. Leaf-sheath oral hairs setose, erect, 10–40 mm long. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 15–30 cm long, 10–35 mm wide. Leaf-blade surface scabrous, glabrous or pilose or hispid, sparsely hairy. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, dense, 10–30 cm long. Panicle branches flexuous, scabrous. Spikelets solitary. Fertile spikelets sessile or pedicelled. Pedicels present, filiform, 5–20 mm long.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–30 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 1–4 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute, awned, 1 -awned, awn 1–3 mm long. Upper glume ovate, 3–4 mm long, membranous, without keels. Upper glume apex acute, awned, 1 -awned, awn 0.5–5 mm long.

Florets. Fertile lemma lanceolate, 8–10 mm long, coriaceous, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acute, muticous or awned, 1 -awned. Principal lemma awn 3.5 mm long overall. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 6 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Aulonemia hirtula (Pilger) McClure. *Smithsonian Contrib. Bot.* 9: 56 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Pataz (B; IT: US-1126709 (fragm. ex B), US-2808853 (fragm. ex B), US-1498110 (fragm. ex B), US-1517225 (fragm. ex B)).

Illustrations (Journals): *Ruizia* (13:24, Fig. 1h-i (1993)).

Derivation (Clifford & Bostock 2007): *L. hirtus*, hairy; *-ula*, diminutive. Somewhat hairy with respect to some or all parts.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 150–200 cm long, woody. Culm-internodes terete. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades linear or lanceolate, 8–12 cm long, 9–10 mm wide. Leaf-blade venation without cross veins. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 10–15 cm long. Primary panicle branches appressed. Panicle branches capillary, flexuous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 22–28 mm long, 2–5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2 mm long, 0.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 0.5 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex obtuse.

Florets. Fertile lemma oblong, 10 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador, Peru.

Aulonemia humillima (Pilger) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Arundinaria humillima* Pilg., *Verh. Bot. Vereins Prov. Brandenburg* 47: 100 (1905)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *E. Ule 6598*, Nov 1902, Peru: Loreto (B; IT: US-2808852 (fragm. ex B)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L.* most low growing. Low growing with respect to related species.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 50–70 cm long, woody. Culm-internodes terete. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs setose. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 6–12 cm long, 5–8 mm wide. Leaf-blade venation without cross veins.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, 10 cm long. Panicle branches capillary. Spikelets ascending or spreading, solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 9–10 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1.5–2 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 0.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute. Upper glume ovate, 0.5 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, 4.4–4.6 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

Aulonemia insignis Judz. & Gibbons. *J. Bot. Res. Inst. Texas* 5 (2): 486–491, f. 1, 2A, 3, 4A–D (2011).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Dept. La Paz: Prov. Bautista Saavedra, Área Natural de Manejo Integrado Apolobamba, sector Tajamarca, más allá de Chaka, por el antiguo camino Laji Sorapata - Apolo, 14°52'12"S, 68°46'28"W, 2906 m, 12 Apr 2009, bosque bajo de yungas en ceja de monte inferior pluvial de filos, planeas alcholizadas, tejido en silicagel, bambú cerca de 1.7 m, botones, flores, espiguillas pardas, A. Illustrations (Journals): *J. Bot. Res. Inst. Texas* (5 (2): 490, Fig.3 (2011)).

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms nodding at the tip or drooping at the tip, 100–170 cm long, 1–35 mm diam., woody. Culm-internodes terete, solid. Lateral branches dendroid. Branch complement one. Leaves 9 per branch. Leaf-sheaths hispid, hairs yellow and purple. Leaf-sheath oral hairs setose, curly, 20–40 mm long. Leaf-sheath auricles erect, 2.5–5 mm long. Ligule absent. Collar with external ligule. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath, petiole 0.4–0.6 cm long, petiole pubescent. Leaf-blades reflexed, lanceolate, 13–17.5 cm long, 40–47 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acute.

Inflorescence. Synflorescence on a separate leafless culm (or few leaves).

Inflorescence a panicle. Panicle open, globose, effuse, 20–25 cm long, 20–25 cm wide, bearing few spikelets. Primary panicle branches ascending. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–35 mm long, 2–2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.3–1.3 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume lanceolate or ovate, 3–4.7 mm long, membranous, without keels, 5–7 -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, with palea. Lemma of lower sterile floret ovate, 5–6 mm long, acute. Fertile lemma ovate, 6–7.3(–9) mm long, herbaceous, purple, without keel, 7–9 -veined, more than 3-veined. Lemma apex acute. Palea 6–7.5 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.3–1.7 mm long, veined, ciliate. Anthers 3, 2.7–3.5 mm long, purple. Stigmas 2.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Cerro Jaua: *Steyermark 98093* (US holo, F, NY).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (43, Fig. 22).

Illustrations (Journals): *Novon* (1:81, Fig.3 (1991)).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Cerro Jaua, Venezuela.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 500–1000 cm long, 10 mm diam., woody. Culm-internodes terete, thick-walled, smooth, distally glabrous. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs setose, 10–20 mm long, dark. Ligule an eciliate membrane, 0.5–0.7 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.6 cm long. Leaf-blades lanceolate or ovate, 15–20 cm long, 30–45 mm wide. Leaf-blade surface glabrous or puberulous, hairy abaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Peduncle 25–30 cm long. Panicle open, ovate, 25–30 cm long. Primary panicle branches ascending, 8–12 cm long. Panicle branches stiff, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–23 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, curved, subterete, 20–70 mm long, 2–3.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3–4 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2.5–3 mm long, membranous, purple, without keels, 1–3 -veined. Lower glume lateral veins absent or obscure. Lower glume apex acute. Upper glume ovate, 5–6 mm long, membranous, purple, without keels, 5–7 -veined. Upper glume surface puberulous. Upper glume apex obtuse or acute.

Florets. Basal sterile florets 1, developed, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret present, similar to upper glume, ovate, 7–8 mm long, 3–5 -veined, acute. Fertile lemma ovate, 10–13 mm long, 4 mm wide, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex acute. Palea 7–8 mm long. Palea keels ciliate.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Aulonemia laxa (F. Maekawa) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Matudacalamus laxus* F. Maek., *J. Jap. Bot.* 36(10): 345 (1961). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Maekawa & Tateoka 603183*, Mexico: Chiapas (TI; IT: MEXU).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. loose*. Inflorescence much branched either as a single panicle or from branching of the culms.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 100–120 cm long, 4–4.5 mm diam., woody. Culm-internodes terete, thin-walled, 7.5–21 cm long. Lateral branches dendroid, erect. Bud complement 1. Branch complement one, solitary. Culm-sheaths present. Leaf-sheaths 7.5–10 cm long, glabrous on surface. Leaf-sheath oral hairs setose, 15–20 mm long. Ligule an eciliate membrane, 0.8–1 mm long. Collar with external ligule. Leaf-

blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or oblong, 15–24.5 cm long, 42–48 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 30 cm long. Primary panicle branches 3–4 in number, ascending or spreading or drooping. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 35–48 mm long, 3 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 8 mm long.

Glumes. Glumes several, 3 empty glumes, persistent, similar, shorter than spikelet. Upper glume ovate, 13 mm long, membranous, without keels.

Florets. Fertile lemma ovate, 17–20 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 8.5–14.2 mm long overall. Palea 15 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 2.8 mm long. Anthers 3, 10.5 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Gulf (Mexico), Southwest Mexico, Southeast Mexico.

TYPE from Ecuador. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Camp E-2177*, 10 March 1945, Ecuador: Azuay: 2745 m (US-2011118; IT: NY).

Illustrations: None found.

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);

Derivation (Clifford & Bostock 2007): *L. longus*, long; *arista*, bristle. Lemmas or glumes long awned.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, erect at the tip or inclined at the tip, 200–400 cm long, 9–18 mm diam., woody. Culm-internodes terete, thin-walled, 30–40 cm long, distally glabrous. Culm-nodes swollen, with distinct supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, 10.5–13 cm long, auriculate, setose on shoulders. Culm-sheath blade lanceolate, reflexed, 4.5–5.5 cm long. Leaf-sheaths keeled, glabrous on surface, outer margin glabrous. Leaf-sheath oral hairs setose, erect, 15–40 mm long. Leaf-sheath auricles falcate. Ligule an eciliate membrane, 0.5–1 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.4–1.2 cm long. Leaf-blades reflexed, ovate, 14–29 cm long, 35–100 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface smooth or scabrous, rough abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 14–20 cm long. Panicle branches angular, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 10–15 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 24–34 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 2.5–5 mm long, pubescent. Floret callus evident, 3–5 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 5–6 mm long, membranous, without keels, 3 -veined. Lower glume surface pubescent. Lower glume apex acute, awned, 1 -awned, awn 1–4 mm long. Upper glume lanceolate, 6–7 mm long, membranous, without keels, 5–7 -veined. Upper glume surface pubescent. Upper glume apex acuminate, awned, 1 -awned, awn 3.7–4.8 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret ovate, 11–13 mm long, membranous, 7–9 -veined, pubescent, awned. Awn of lower sterile floret 4.5–5.5 mm long.

Fertile lemma ovate, 10–20.4 mm long, chartaceous, without keel, 9 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn straight or curved, 9.5–20 mm long overall. Palea 2.5–11.2 mm long, 4 -veined. Palea surface pubescent. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 5–5.4 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador.

Aulonemia longipedicellata Renvoize. *Gr. Boliv.* 41 (1998).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolivia, Nor Yungas: *Solomon 5205* (LPB holo, MO).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (34, Fig. 3).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *pedicellus*, stalk; -ata, possessing. Spikelets with long pedicels.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms leaning, 200 cm long, woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 3 mm long. Leaf-blade base cordate, asymmetrical, with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 12–14 cm long, 30 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 20–23 cm long. Panicle branches glabrous, with insignificant pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 30–90 mm long.

Fertile Spikelets. Spikelets comprising 6–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–23 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 1.5–2 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume margins ciliate. Lower glume apex acute. Upper glume ovate, 2.5–3.5 mm long, membranous, without keels, 3 -veined. Upper glume margins ciliate. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6–6.5 mm long, herbaceous, without keel, 7 -veined, more than 3-veined. Lemma apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Aulonemia madidiensis Judz., D.C. Ziegler & Zueger. *J. Bot. Res. Inst. Texas* 5 (2): 494–498, f. 6–8 (2011).

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 500 cm long, 25 mm diam., woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Leaves 5 per branch. Leaf-sheaths keeled, smooth (shiny), glabrous on surface. Leaf-sheath oral hairs setose, spreading, 12–20 mm long, pale. Ligule an eciliate membrane, 1–7.5 mm long. Collar with external ligule. Leaf-blade base broadly rounded, with a brief petiole-like connection to sheath, petiole 0.7–1 cm long. Leaf-blades lanceolate or ovate, 25–37 cm long, 70–105 mm wide. Leaf-blade venation without cross veins. Leaf-blade apex acuminate. Flowering specimens unknown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Guyana.

Aulonemia parviflora (Presl) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Guadua parviflora* J. Presl, *Reliq. Haenk.* 1(4–5): 257 (1830). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Haenke s.n.*, no date, Peru: (PR; IT: US-79107).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. parvus*, small; *flos*, flower. Spikelets small or with few florets.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 300–500 cm long, woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 30–35 cm long, 35–42 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface scabrous. Leaf-blade margins glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 20–30 cm long. Primary panicle branches ascending. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 25 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 0.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute or acuminate. Upper glume ovate, 0.5 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, 10–12 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma apex acute. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 6. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

Aulonemia patriae R.W. Pohl. *Fieldiana, Bot.*, n.s., 4: 68 (1980).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Costa Rica, Heredia: *Pohl & Gabel 13577* (ISC holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): From the Rio Patria, Costa Rica.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 300–500 cm long, 5–10 mm diam., woody. Culm-internodes terete, thin-walled, 50–100 cm long, distally glabrous. Culm-nodes without obvious supra-nodal ridge, viscid (below node). Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, persistent, green or green or purple, concolorous or distinctly mottled with last colour. Leaf-sheaths viscid (at apex), glabrous on surface. Leaf-sheath oral hairs setose, 10–30 mm long. Ligule a ciliolate membrane, 1.2–2 mm long. Collar with external ligule. Leaf-blade base broadly rounded, asymmetrical, with a brief petiole-like connection to sheath, petiole 0.5–0.6 cm long. Leaf-blades spreading or drooping, ovate, 20–26 cm long, 40–80 mm wide, dark green or glaucous (above/below), discolorous with last colour beneath. Leaf-blade venation without cross veins. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle 15–25 cm long. Panicle open, pyramidal, 20–40 cm long. Primary panicle branches ascending, 1-nate, branching divaricately, 15–34 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 20–40 mm long.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 25–40 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 6–8.5 mm long.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 5–7 mm long, 0.75–1 length of upper glume, membranous, without keels, 7 -veined. Lower glume apex acute. Upper glume ovate, 7 mm long, 0.5 length of adjacent fertile lemma, membranous, without keels, 11 -veined. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 13–17 mm long, chartaceous, without keel, 9–11 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex acute. Palea 1 length of lemma. Palea keels ciliolate. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, obovate, ciliate. Anthers 3, 9 mm long. Stigmas 2. Caryopsis with adherent pericarp, oblong, 8–10 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica, Panama.

Aulonemia patula (Pilger) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. **Basionym or Replaced Name:** *Arundinaria patula* Pilg., *Bot. Jahrb. Syst.* 25(5): 719 (1898). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Stübel 465, no date, Colombia (B; IT: US-2809008).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. outspread. Inflorescence an open panicle.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms arching, 250–500 cm long, 5–15 mm diam., woody. Culm-internodes terete, thin-walled. Lateral branches dendroid. Branch complement many. Culm-sheaths present. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs setose. Ligule an eciliate membrane, truncate. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or ovate, 10–25 cm long, 30–60 mm wide. Leaf-blade margins scabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, globose, effuse, 20–40 cm long. Primary panicle branches spreading, 1 -nate, 30 cm long. Panicle axis angular, smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 3–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 20–40 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4.5 mm long, membranous, without keels. Lower glume apex acuminate. Upper glume lanceolate, 8 mm long, membranous, without keels. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15 mm long, coriaceous, without keel, 7 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 1–3 mm long overall. Palea 10 mm long. Palea keels ciliolate, adorned above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador, Peru.

Aulonemia pumila L.G. Clark & X. Londono. *Ann. Missouri Bot. Gard.* 77(2): 356 (1990).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Pasto to Sibundoy: *Londono & Glark 382* (COL holo, MO, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. dwarf, low growing. Habit typically depauperate.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or geniculately ascending, 50–100 cm long, 2–3 mm diam., woody. Culm-internodes terete, thick-walled, 8–10 cm long, distally pubescent. Culm-nodes swollen, with distinct supra-

nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, 5–5.5 cm long, without auricles, glabrous on shoulders or setose on shoulders, shoulders with 2–6 mm long hairs. Culm-sheath blade lanceolate, reflexed, 0.8 cm long. Leaf-sheaths glabrous on surface or pubescent, outer margin glabrous. Leaf-sheath oral hairs setose, erect, 5–6 mm long. Ligule an eciliate membrane, 0.5 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.15 cm long. Leaf-blades reflexed, ovate, 5–7 cm long, 6–14 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface glabrous or pubescent, hairy abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, dense, 5.5–11 cm long. Primary panicle branches appressed or ascending. Panicle axis pubescent. Panicle branches angular, pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 2–9 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 8.4–11.2 mm long, breaking up at maturity, disarticulating below each fertile floret (or the lowest persistent). Floret callus evident, 1–2 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume surface pubescent. Lower glume apex acute, awned, 1 -awned, awn 6 mm long. Upper glume ovate, 5 mm long, membranous, without keels, 3–5 -veined. Upper glume surface pubescent. Upper glume apex acuminate, awned, 1 -awned, awn 3 mm long.

Florets. Fertile lemma ovate, 5.5–9.2 mm long, chartaceous, without keel, 5–7 -veined, more than 3-veined. Lemma surface pubescent. Lemma apex setaceously acuminate. Palea 4.3–6.3 mm long, 4 -veined. Palea keels ciliate. Palea surface pubescent, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.
n = 20 (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Aulonemia purpurata (McClure) McClure. *Smithsonian Conrib. Bot.*, 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Arthrostylidium purpuratum* McClure, *J. Wash. Acad. Sci.* 32(6): 170, f. 3 (1942)

. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *L. Williams 10905*, 1938, Venezuela: Federal District (US-2808831).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. purpureus*, purple; *-ata*, possessing. Inflorescence or spikelets purple.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms woody. Culm-internodes terete, thick-walled. Lateral branches dendroid. Bud complement 1. Branch complement in a clump, subtended by a bare patch above the node, with subequal branches. Culm-sheaths present. Leaf-sheaths striately veined, glabrous on surface. Leaf-sheath oral hairs setose, 5–10 mm long. Leaf-sheath auricles erect. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long, petiole glabrous. Leaf-blades lanceolate, 5–10.5 cm long, 6–12 mm wide. Leaf-blade venation with 8–10 secondary veins, without cross veins. Leaf-blade surface pubescent, sparsely hairy, hairy abaxially. Leaf-blade margins cartilaginous, scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle 10–15 cm long. Racemes 1, single, paucilateral, 5–10 cm long. Rhachis angular, scabrous on margins. Spikelet packing broadside to rhachis. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–3 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the

upper sterile. Spikelets linear, laterally compressed, 35–45 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes clavate, 4–7 mm long, eventually visible between lemmas.

Glumes. Glumes persistent, shorter than spikelet. Lower glume lanceolate, 3–4 mm long, chartaceous, without keels, 4 -veined. Lower glume primary vein scabrous. Lower glume apex acute, awned, 1 -awned, awn 1–2 mm long. Upper glume lanceolate, 7–8 mm long, purple, 1-keeled or 2-keeled, 3 -veined. Upper glume primary vein scabrous. Upper glume surface glabrous to pubescent, hairy above. Upper glume margins ciliolate. Upper glume apex entire or dentate, 2 -fid, acute, awned, 1 -awned, awn 1–2 mm long.

Florets. Fertile florets increasing in size upwards. Fertile lemma lanceolate, 10–11 mm long, chartaceous, purple, without keel, 7 -veined, more than 3-veined. Lemma surface scabrous. Lemma margins ciliate, hairy above. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 7 mm long overall. Palea 9–10 mm long, 0.9 length of lemma. Palea keels ciliolate. Palea surface scabrous, pubescent, hairy on back, hairy above. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1.5–2 mm long, ciliate. Anthers 2, 7 mm long. Stigmas 2. Ovary umbonate, glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Aulonemia queko Goudot. *Ann. Sc. Nat. Ser. 3, 5: 76 t. 5* (1846).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia, Quindiu Mt.: *Goudot* (P holo).

Illustrations (Books): E.J.Judziewicz et al, *American Bamboos* (1999) (166, Fig. 75 & 167, Fig. 76).

Illustrations (Journals): *Smithsonian Contributions to Botany* (9: 57, Fig. 24; 59, Fig. 25; 60, Fig. 26 (1973)).

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);

Derivation (Clifford & Bostock 2007): vernacular name in Colombia for the flute made from the internode of *Aulonemia queko*.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 800–1000 cm long, 30 mm diam., woody. Culm-internodes terete, thick-walled. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement many, in a clump. Culm-sheaths present, setose on shoulders. Culm-sheath blade linear, reflexed. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs setose. Ligule an eciliate membrane. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or ovate, 13–20 cm long, 33–50 mm wide. Leaf-blade venation without cross veins. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 5–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 25–50 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 3 mm long, 0.6 length of upper glume, membranous, without keels, 7 -veined. Lower glume surface puberulous. Lower glume apex obtuse, awned, 1 -awned, awn 5 mm long. Upper glume ovate, 5 mm long, 0.5 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume surface puberulous. Upper glume apex obtuse, awned, 1 -awned, awn 5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea, persisting on inflorescence. Lemma of lower sterile floret similar to fertile lemma, oblong, 10 mm long, 7 -veined, puberulous, obtuse, awned. Awn of lower sterile floret 6 mm long. Fertile lemma oblong, 10–12 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex obtuse, pungent, 1 -awned. Principal lemma awn 5 mm long overall. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia, Ecuador, Peru.

Aulonemia radiata (Rupr.) McClure & L. B. Smith. *Fl. Illustr. Catar., Pt. 1, Gramin., Supl. Bambus.* 56 (1967).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria radiata* Rupr., *Bambuseae* 25, t. 15, f. 9 (1839). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L. Riedel s.n.*, Jan, Brazil, without locality, in sylvia umbrosis (LE (photo, US); IT: US-280919).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (123, Fig. 26).

Derivation (Clifford & Bostock 2007): *L. radius*, spoke of a wheel; *-ata*, possessing. With racemes arranged in fascicles along a central axis.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 10 mm diam., woody. Culm-internodes terete, thin-walled, smooth, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid, ascending or spreading. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, deciduous, 6 cm long. Leaf-sheaths striately veined, pubescent. Leaf-sheath oral hairs setose. Ligule an eciliate membrane. Collar with external ligule. Leaf-blade base cuneate, with a brief petiole-like connection to sheath. Leaf-blades spreading, oblong, 10–19 cm long, 10–20 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle, terminal and axillary. Panicle open, linear, 10–20 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30–50 mm long, 2 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two or several, 2–3 empty glumes, persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 5 mm long, 0.9 length of upper glume, membranous, without keels. Lower glume apex setaceously acuminate. Upper glume ovate, 5 mm long, membranous, without keels. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 7.5 mm long, chartaceous, without keel, more than 3-veined. Lemma surface puberulous, hairy above. Lemma apex acute, awned, 1 -awned. Principal lemma awn 2–4 mm long overall. Palea 8 mm long. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast, Brazil South.

Catarina, Rio Grande do Sul. Minas Gerais, Rio de Janeiro, Sao Paulo. Paraná, Santa Catarina.

Aulonemia ramosissima (Hackel) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria ramosissima* Hack., *Oesterr. Bot. Z.* 53(2): 74 (1903). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.F.M. Glaziou 20149*, 4 Jun 1892, Brazil: Rio de Janeiro (W; IT: US-80199). Also type collection of *Arundinaria glaziovii* var. *macroblephara* Camus, *Bambusées* 41 (1913).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. ramus*, branch; *-osa*, abundance; *-issima*, most. Culms much branched.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms woody. Culm-internodes terete. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheaths mostly shorter than adjacent culm internode, glabrous on surface. Leaf-sheath oral hairs setose, 25 mm long. Ligule an eciliate membrane, 0.5 mm long, truncate. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades ovate, 5–15 cm long, 10–25 mm wide. Leaf-blade venation with distinct cross veins. Leaf-blade surface scaberulous, rough abaxially, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, dense, 15–30 cm long. Primary panicle branches appressed, 1-nate, 10–20 cm long. Panicle axis scabrous. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 40 mm long, 2.5 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 4 mm long, glabrous.

Glumes. Glumes several, 4 empty glumes, persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3–4 mm long, membranous, without keels, 3–5 -veined. Lower glume apex obtuse, mucronate. Upper glume lanceolate, 5–7 mm long, membranous, without keels, 5–7 -veined. Upper glume apex obtuse, mucronate.

Florets. Fertile lemma lanceolate, 7–8 mm long, chartaceous, without keel, 7 -veined, more than 3-veined. Lemma lateral veins obscure. Lemma apex obtuse, mucronate. Palea keels ciliolate.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana. Rio de Janeiro.

Aulonemia robusta L.G. Clark & X. Londono. *Ann. Missouri Bot. Gard.* 77(2): 356 (1990).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela, Paramo La Laguna: *Clark, Gaviria & Adamo 533* (VEN holo, ISC, MO, NY, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. robust*. Culms tall, or leaf-blades or spikelets large.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–400 cm long, 10–25 mm diam., woody. Culm-internodes terete, thin-walled, distally mealy or glabrous. Culm-nodes swollen, with distinct supra-nodal ridge. Lateral branches dendroid. Buds or branches absent from lower part of culm. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, 12–12.5 cm long, without auricles, setose on shoulders, shoulders with 20–30 mm long hairs. Culm-sheath blade lanceolate, reflexed, 6–8.5 cm long. Leaf-sheaths without keel, glabrous on surface, outer margin hairy. Leaf-sheath oral hairs setose, erect, 30–40 mm long. Ligule an eciliate membrane, 2–8 mm long. Collar with external ligule. Leaf-blade base broadly rounded, with a brief petiole-like connection to sheath, petiole 0.5–0.7 cm long. Leaf-blades reflexed, ovate, 19–32 cm long, 5–13.5 mm wide. Leaf-blade venation without cross veins. Leaf-blade surface scabrous, rough abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 35–50 cm long. Primary panicle branches ascending. Panicle axis smooth. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 2–10 mm long, smooth.

Fertile Spikelets. Spikelets comprising 4–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 11–16 mm long, breaking up at maturity,

disarticulating below each fertile floret. Rhachilla internodes 1.5–2 mm long, glabrous or pubescent. Floret callus evident, 1–2 mm long.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 2.5–4 mm long, membranous, without keels, 3 -veined. Lower glume apex acute, awned, 1 -awned, awn 0.5–1 mm long. Upper glume ovate, 4–4.7 mm long, membranous, without keels, 5–7 -veined. Upper glume surface puberulous, hairy at apex. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 5.3–6.7 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex acuminate. Palea 5.3–6.4 mm long, 2 -veined. Palea surface pubescent, hairy on back. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 0.9–1.2 mm long, ciliate. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Western South America.** Colombia.

Illustrations (Journals): *J. Bot. Res. Inst. Texas* 4 (2): 576 & 577, Figs 5 & 6 (2010)).

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Butt sheaths absent. Culms 50 cm long, 7 mm diam., woody. Culm-internodes terete, thin-walled, distally glabrous. Culm-nodes viscid (below node). Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present, yellow and purple, distinctly mottled with last colour, glabrous. Culm-sheath blade inconspicuous or lanceolate, reflexed, 0–2 cm long. Leaves 6–12 per branch. Leaf-sheaths viscid, striately veined, glabrous on surface or pubescent, outer margin glabrous. Leaf-sheath oral hairs scanty, curly, 4–8 mm long. Leaf-sheath auricles absent or erect, 3 mm long. Ligule an eciliate membrane, 1.5–2.5 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.5–0.6 cm long. Leaf-blades reflexed, lanceolate, 16–18 cm long, 20–27 mm wide, indurate, viscid. Leaf-blade surface scaberulous, rough abaxially, glabrous. Leaf-blade margins cartilaginous, scaberulous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle 6–8 cm long, smooth, glabrous. Panicle open, ovate, loose, 20–23 cm long, 12–20 cm wide. Primary panicle branches 3–6 in number, ascending, 1 -nate. Panicle branches capillary, scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 6–24 mm long.

Fertile Spikelets. Spikelets comprising 6–8 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 18.3–23.1 mm long, 2.9–5.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 2.1–3 mm long, 0.33 length of upper glume, membranous, without keels, 3–7 -veined. Lower glume surface pubescent. Lower glume apex acute. Upper glume lanceolate, 6–7.8 mm long, 0.66 length of adjacent fertile lemma, membranous, without keels, 9–11 -veined. Upper glume surface pubescent. Upper glume apex acute, mucronate or awned, 1 -awned, awn 0.4–0.5 mm long.

Florets. Fertile florets decreasing in size upwards. Fertile lemma lanceolate, 9.1–11.6 mm long, 1.5–2.1 mm wide, chartaceous, without keel, 9–15 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 1–4.7 mm long overall. Palea elliptic, 8–11 mm long, 1 length of lemma. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, 1–1.3 mm long, veined, ciliate. Anthers 3, 4.5 mm long, yellow or brown. Caryopsis with adherent pericarp, oblong, 4.3–5.9 mm long. Embryo 0.66 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. South America.
Country /Province /State. Western South America.

Aulonemia setigera (Hackel) McClure. *Smithsonian Contrib. Bot.* 9: 58 (1973).

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria setigera* Hack., *Oesterr. Bot. Z.* 53(2): 73 (1903). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: ST: A.F.M. Glaziou 17916, Dec 1888, Brazil: Rio de Janeiro (W; IST: US-2809005 (fragm. ex W)). ST: *Glaziou 470*, Brazil: Rio de Janeiro (W).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *gero*, carry. With hairs or awns on the glumes or lemmas.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 500–1000 cm long, woody. Culm-internodes terete, solid. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheaths subequal to internodes, smooth. Leaf-sheath oral hairs setose. Ligule an eciliate membrane, 1 mm long, truncate. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.8 cm long. Leaf-blades ovate, 12–24 cm long, 30–50 mm wide, mid-green and glaucous, discolorous with last colour beneath. Leaf-blade venation with distinct cross veins. Leaf-blade margins scaberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 20–45 cm long. Primary panicle branches 1-nate, 12–24 cm long. Panicle axis smooth. Panicle branches with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 5–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 40–50 mm long, 3 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 3 mm long, scaberulous, glabrous.

Glumes. Glumes several, 4 empty glumes, persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 3–4 mm long, membranous, without keels, 3–5 -veined. Lower glume apex acute, mucronate. Upper glume ovate, 5–7 mm long, membranous, without keels, 5–7 -veined. Upper glume apex acute, mucronate.

Florets. Fertile lemma lanceolate, 6–7 mm long, chartaceous, without keel, 7–9 -veined, more than 3-veined. Lemma lateral veins with cross-veins. Lemma apex obtuse, mucronate, 1 -awned. Principal lemma awn 3–5 mm long overall. Palea 1 length of lemma. Palea keels ciliolate.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3, 6 mm long. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil Southeast.
Minas Gerais, Rio de Janeiro, Espirito Santo. Bahia. Rio de Janeiro.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Butt sheaths absent. Culms scandent, 700–800 cm long, 20–35 mm diam., woody. Culm-internodes terete, thick-walled, yellow or glaucous, distally pubescent. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Branch complement three or several, with 1 branch dominant. Culm-sheaths present, tardily deciduous, 11–28 cm long, 1.3–2 times as long as wide, coriaceous, pubescent, hairy on margins, auriculate, with 5–14 mm high auricles, with 1.5–4 mm wide auricles, setose on shoulders, shoulders with 3–6 mm long hairs. Culm-sheath ligule 1–2.5 mm high. Culm-sheath blade triangular, 7–20 cm long, 15–30 mm wide, pubescent. Leaves cauline, 7–23 per branch. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking or setose, 6–12 mm long. Leaf-sheath auricles absent or falcate, 5–14 mm long. Ligule an eciliate membrane or a ciliolate membrane, 1.5–3 mm long, glabrous on abaxial surface or pubescent on abaxial surface, entire (asymmetrical). Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3–0.5 cm long, petiole glabrous. Leaf-blades deciduous at the ligule, lanceolate or ovate, 6–20 cm long, 8–21 mm wide, glaucous and dark green, variegated (green margins). Leaf-blade venation with 7–13 secondary veins. Leaf-blade surface glabrous. Leaf-blade apex filiform. Flowering specimens unknown.

Aulonemia sodiroana (Hack.) McClure. *Smithsonian Contrib. Bot.*, 9: 61 (1973).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ecuador. **Basionym or Replaced Name:** *Arundinaria sodiroana* Hack., *Oesterr. Bot. Z.* 53(2): 70 (1903). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: T: *A. Sodiro* 237, 1903, Ecuador: Pichincha (W; IT: US-1163141 (fragm. ex W)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Luigi Sodiro (1836–1909) Italian-born Ecuadorean cleric and amateur botanist.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms 10–30 mm diam., woody. Culm-internodes terete, thin-walled, 40–100 cm long, distally glabrous. Lateral branches dendroid. Branch complement many. Culm-sheaths present. Leaf-sheath oral hairs setose, 10–40 mm long. Ligule an eciliate membrane, 2 mm long, truncate. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.3 cm long, petiole glabrous. Leaf-blades lanceolate, 13 cm long, 30 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, globose, 20–40 cm long. Primary panicle branches 15–30 cm long. Panicle axis angular, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 10–20 mm long.

Fertile Spikelets. Spikelets comprising 5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 30 mm long, 3 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4 mm long, membranous, without keels, 5 -veined. Upper glume lanceolate, 7 mm long, membranous, without keels, 7 -veined. Upper glume surface scabrous. Upper glume apex acuminate, awned, 1 -awned, awn 2 mm long.

Florets. Fertile lemma lanceolate, 10–12 mm long, coriaceous, without keel, 7 -veined, more than 3-veined. Lemma surface scaberulous. Lemma apex acute, awned, 1 -awned. Principal lemma awn 4 mm long overall. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, ciliate. Anthers 3, 5 mm long. Stigmas 2. Ovary glabrous. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador.

Aulonemia subpectinata (O. Kuntze) McClure. *Smithsonian Contrib. Bot.* 9: 61 (1973).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Arthrostylidium subpectinatum* Kuntze, *Revis. Gen. Pl.* 2: 760 (1891)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Venezuela: Silla de Caracas, *Kuntze s.n.* (HT: NY).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sub*, approaching; *pecten*, comb; *-ata*, possessing. With setose fimbriae on the margins of the leaf-sheath.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or leaning, 200–600 cm long, 5–10 mm diam., woody. Culm-internodes terete, distally glabrous. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Culm-sheaths present. Leaf-sheaths outer margin hairy. Leaf-sheath oral hairs setose, 10–20 mm long. Ligule an eciliate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades lanceolate or ovate, 10–15 cm long, 10–40 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, dense, 30–50 cm long. Primary panicle branches appressed. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3 mm long, membranous, without keels. Lower glume apex acute. Upper glume lanceolate, 5 mm long, membranous, without keels. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 7–8 mm long, chartaceous, without keel, more than 3-veined. Lemma surface puberulous. Lemma apex obtuse.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

Aulonemia tremula Renvoize. *Gr. Boliv.* :39 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolivia, Nor Yungas: *Beck 5361* (LPB holo, K).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (34, Fig. 3).

Derivation (Clifford & Bostock 2007): *L. trembling*. Inflorescence subject to movement in a slight breeze.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 400–1000 cm long, 2 mm diam., woody. Culm-internodes terete, thick-walled. Lateral branches dendroid. Culm-sheaths present. Leaf-sheaths punctate. Leaf-sheath oral hairs pubescent. Ligule an eciliate membrane, 0.2 mm long. Leaf-blade base asymmetrical, with a brief petiole-like connection to sheath. Leaf-blades lanceolate, 8–15 cm long, 10–20 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 10–20 cm long. Primary panicle branches spreading. Panicle branches pilose, with prominent pulvini. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 5–45 mm long.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 10–20 mm long, 0.5–1 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume ovate, 0.5–1.5 mm long, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume surface pubescent, hairy at apex. Lower glume apex obtuse. Upper glume ovate, 2–3 mm long, membranous, without keels, 3–5 -veined. Upper glume surface pubescent, hairy at apex. Upper glume apex obtuse.

Florets. Fertile lemma oblong, 5.5–6.5 mm long, herbaceous, purple, without keel, 5 -veined, more than 3-veined. Lemma apex acute. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). **Continent.** South America.

Country /Province /State. **Western South America.** Bolivia.

TYPE from Brazil. **Basionym or Replaced Name:** *Arundinaria ulei* Hack., *Oesterr. Bot. Z.* 53(2): 75 (1903)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E. Ule* 1955, 1891, Brazil: Santa Catarina (W; IT: US-2808997).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (123, Fig. 26).

Images: E.J.Judziewicz, E.J., *American Bamboos* (1999);.

Derivation (Clifford & Bostock 2007): in honor of Ernst Heinrich Georg Ule (1854–1915) German botanist sometime resident in Brazil.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect, 200–300 cm long, 6 mm diam., woody. Culm-internodes terete, thin-walled, 8–16 cm long, smooth, distally glabrous. Culm-nodes glabrous. Lateral branches dendroid, erect. Bud complement 1. Branch complement one, solitary. Culm-sheaths present. Leaf-sheaths striately veined, pubescent. Leaf-sheath oral hairs setose, 8 mm long, pale. Ligule an eciliate membrane. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath. Leaf-blades appressed or erect, lanceolate, 4–8 cm long, 5–9 mm wide, stiff. Leaf-blade venation with distinct cross veins. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 8–15 cm long. Primary panicle branches indistinct the panicle almost racemose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1–3 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets, or of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 18–22 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes two or several, 2–3 empty glumes, persistent, similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 7 mm long, 0.75 length of upper glume, membranous, without keels. Lower glume apex acute, awned, 1 -awned, awn 5 mm long. Upper glume lanceolate, 10 mm long, membranous, without keels. Upper glume apex acute, awned, 1 -awned, awn 3 mm long.

Florets. Fertile lemma lanceolate, 12 mm long, chartaceous, without keel, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 3 mm long overall. Palea 1 length of lemma. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.

Sao Paulo Parana, Catarina, Rio Grande do Sul. Rio Grande do Sul, Santa Catarina.

Aulonemia viscosa (Hitchcock) McClure. *Smithsonian Contrib. Bot.* 9: 61 (1973).

TYPE from Coasta Rica. **Basionym or Replaced Name:** *Arundinaria viscosa* Hitchc., *Proc. Biol. Soc. Wash.* 40: 79 (1927). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Collected in forests at the summits of Velirla, Copey, Costa Rica, 1800 to 2700 m, Feb 1898, A. *Tonduz* 11729 (HT: US-577479).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (70, Fig. 18).

Derivation (Clifford & Bostock 2007): L. sticky. Panicle-branches or foliage sticky.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or scandent, 400–500 cm long, 5–15 mm diam., woody. Culm-internodes terete, thin-walled, mid-green or purple, mottled, distally glabrous. Culm-nodes without obvious supra-nodal ridge, viscid. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary, as thick as stem. Culm-sheaths present, persistent, green or purple, distinctly mottled with last colour. Leaf-sheaths glabrous on surface. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 1–2.5 mm long. Collar with external ligule. Leaf-blade base broadly rounded, asymmetrical, with a brief petiole-like connection to sheath, petiole 0.5–0.7 cm long, petiole glabrous (viscid). Leaf-blades ovate, 21–26 cm long, 40–50 mm wide, dark green or glaucous (above/below), discolorous with last colour beneath. Leaf-blade venation without cross veins. Leaf-blade surface scaberulous, rough abaxially. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Peduncle glabrous (viscid). Panicle open, pyramidal, 15–25 cm long. Primary panicle branches ascending, 1-nate. Panicle branches viscid. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flexuous.

Fertile Spikelets. Spikelets comprising 3–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 15–25 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, dissimilar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 3–5 mm long, 0.5 length of upper glume, membranous, without keels, 3-veined. Lower glume apex acute. Upper glume ovate, 7–9 mm long, 0.5 length of adjacent fertile lemma, membranous, without keels, 7-veined. Upper glume apex obtuse.

Florets. Fertile lemma ovate, 13–14 mm long, chartaceous, without keel, 7-veined, more than 3-veined. Lemma apex obtuse. Palea 1 length of lemma. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, ovoid, dark brown.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America. Costa Rica. Venezuela.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo. Rhizomes short, pachymorph. Butt sheaths absent. Culms scandent, 200–500 cm long, 3–6(–10) mm diam., woody. Culm-internodes terete, thick-walled, 10–26 cm long, distally hispid (above). Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid, intravaginal. Bud complement 1. Culm-sheaths present, tardily deciduous, 10–18 cm long, 4–8 times as long as wide, glabrous or hispid, hairy on margins, setose on shoulders, shoulders with 7–15 mm long hairs. Culm-sheath blade lanceolate, constricted at base, deciduous, reflexed, 3–10 cm long, 8–25 mm wide. Leaf-sheaths striately veined, glabrous on surface or pubescent, outer margin hairy. Leaf-sheath oral hairs setose, curly, 7–15 mm long. Ligule an eciliate membrane, 0.5 mm long. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.2–0.5 cm long, petiole pubescent. Leaf-blades reflexed, lanceolate, 8–17 cm long, 10–28 mm wide. Leaf-blade surface glabrous or puberulous, hairy abaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Peduncle 3–7 cm long. Panicle open, loose, 15–20 cm long, 4–10 cm wide. Panicle branches capillary, smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising (4–)5(–9) fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear or oblong, laterally compressed, 13–36 mm long, 3–5.5 mm wide, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 4–5.5 mm long, membranous, without keels, 1–3(–5) -veined. Lower glume lateral veins absent or distinct. Lower glume apex acute. Upper glume lanceolate, 6–8.5 mm long, membranous, without keels, 3–5(–7) -veined. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to fertile lemma. Fertile lemma lanceolate, 8–12.5 mm long, chartaceous, without keel, 7–11 -veined, more than 3-veined. Lemma apex acute, mucicous or awned, 1 -awned. Principal lemma awn 1.5–3(–5) mm long overall. Palea 1 length of lemma, 2-keeled. Palea keels winged (above), narrowly winged, scabrous. Palea surface scaberulous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3, obovate, 1–1.4 mm long, veined, ciliate. Anthers 3, 3–4 mm long, purple. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America and Western South America. Venezuela. Colombia.

Classification. Subfamily Bambusoideae. Tribe: Bambuseae.

Habit, Vegetative Morphology. Perennial, woody bamboo, caespitose. Rhizomes short, pachymorph. Butt sheaths absent. Culms erect or scandent, 100–200 cm long, 20–30 mm diam., woody. Culm-internodes terete, distally glabrous or pubescent. Culm-nodes without obvious supra-nodal ridge. Lateral branches dendroid. Bud complement 1. Branch complement one, solitary. Culm-sheaths present. Leaves 3–4 per branch. Leaf-sheaths pilose, with tubercle-based hairs. Leaf-sheath oral hairs setose, spreading, 8–17(–30) mm long. Leaf-sheath auricles falcate, 3–4.5 mm long. Ligule absent. Collar with external ligule. Leaf-blade base with a brief petiole-like connection to sheath, petiole 0.1–0.2 cm long. Leaf-blades reflexed, deciduous at the ligule, lanceolate, 7–14 cm long, 13–22(–30) mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 16–24 cm long, 6–25 cm wide. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising (4–)5–7(–8) fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, laterally compressed, 20–37 mm long, 1–2 mm wide, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 4.5–5.8 mm long.

Glumes. Glumes persistent, shorter than spikelet. Lower glume lanceolate or ovate, 2.5–3 mm long, 0.66–0.75 length of upper glume, membranous, without keels, 7 -veined. Lower glume surface puberulous. Lower glume apex acute. Upper glume lanceolate, (3–)3.8–4.5 mm long, 0.5–0.66 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume surface puberulous. Upper glume apex acute.

Florets. Fertile lemma lanceolate, 6.5–8.5 mm long, chartaceous, without keel, (7–)9 -veined, more than 3-veined. Lemma surface puberulous. Lemma apex acute. Palea 6.5–8.5 mm long, 1.1 length of lemma. Palea keels 0.8–1 mm apart, ciliolate. Palea apex dentate, 2 -fid. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 3. Anthers 3, 3–4 mm long. Stigmas 2. Ovary pubescent all over. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Peru.

Australopyrum calcis Connor & Molloy. *New Zealand Journal of Botany* 31:2 (1993).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand, Marlborough: Molloy & Ryan (CHR holo).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. calx*, lime. Growing on limestone.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Basal innovations intravaginal. Culms geniculately ascending, 17–60 cm long, 3-noded. Culm-nodes swollen, brown or black. Leaf-sheaths 2.5–5 cm long, glabrous on surface or pubescent, with reflexed hairs. Leaf-sheath oral hairs lacking. Leaf-sheath auricles falcate, 0.1–0.5 mm long. Ligule an eciliate membrane, 0.6–1.25 mm long, lacerate. Collar dark, glabrous. Leaf-blades 6–25 cm long, 0.5–3.5 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence composed of racemes. Peduncle glabrous or pubescent above, tipped by a glumaceous appendage. Racemes 1, single, bilateral, 3–13 cm long, bearing 4–13 fertile spikelets on each. Rhachis glabrous on surface or woolly on surface, scabrous on margins. Spikelet packing broadside to rhachis, distant, regular, 2-rowed. Spikelets ascending or spreading, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 4–6 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 1–1.25 mm long, pubescent. Floret callus 0.25–0.4 mm long, pubescent, disarticulating obliquely.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma. Lower glume linear, 2.5–4 mm long, 0.66–0.75 length of upper glume, coriaceous, 1-keeled, 3–5 -veined. Lower glume primary vein scabrous. Lower glume apex acuminate. Upper glume lanceolate, 3.7–5.5 mm long, 0.4–0.5 length of adjacent fertile lemma, coriaceous, 1-keeled, 3–5 -veined. Upper glume primary vein scabrous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic, 7–8 mm long, chartaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma midvein scabrous. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 1.5–4 mm long overall. Palea 5.3–7 mm long. Palea keels scabrous. Palea surface puberulous, hairy on back or on margins. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, 0.4–0.6 mm long, ciliate. Anthers 3, 2.4–2.75 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp, 3.5–4 mm long, hairy at apex. Embryo 0.2 length of caryopsis. Hilum linear, 0.75–1 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand South I.

Derivation (Clifford & Bostock 2007): *L. pecten*, comb; *-ata*, possessing. Inflorescence with spikes or racemes bearing a fanciful resemblance to a comb.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–60 cm long. Culm-internodes distally pubescent, with reflexed hairs. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles falcate. Ligule an eciliate membrane, 0.5 mm long, entire or erose. Leaf-blades 3–20 cm long, 1–4 mm wide, coriaceous, stiff. Leaf-blade surface scaberulous, rough abaxially, puberulous or hirsute, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Racemes 1, single, oblong, bilateral, 1.5–8 cm long, bearing 4–10 fertile spikelets on each. Rhachis pubescent on surface (antrorsely). Spikelet packing broadside to rhachis, distant, 3 spikelets per cm, regular, 2 -rowed. Rhachis internodes oblong. Spikelets spreading or deflexed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 3–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or cuneate, laterally compressed, 10–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus 0.5 mm long.

Glumes. Glumes persistent, similar, shorter than spikelet, firmer than fertile lemma, gaping. Lower glume linear, 4–7 mm long, 0.8 length of upper glume, coriaceous, 1-keeled, 3 -veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, 0.75–1 length of adjacent fertile lemma, coriaceous, 1-keeled, 5–7 -veined. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma elliptic or ovate, 5–11 mm long, chartaceous, keeled, 5–7 -veined, more than 3-veined. Lemma surface asperulous, pubescent. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn 2–3 mm long overall. Palea 4–6.5 mm long. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 1.5 mm long. Ovary pubescent on apex. Caryopsis with adherent pericarp, hairy at apex. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand (*). New South Wales, Queensland, Tasmania, Victoria. New Zealand North I, New Zealand South I. South East. Tablelands, Western Slopes.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. retro*, backwards; *fractus*, broken. With retrorse hairs on the rhachis.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 20–35 cm long, 2–3 -noded. Culm-nodes glabrous. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 0.5 mm long, truncate. Leaf-blades flat or involute, 5–15 cm long, 1–2 mm wide, grey-green. Leaf-blade surface ribbed, scabrous, pubescent.

Inflorescence. Inflorescence composed of racemes. Peduncle hirsute above. Racemes 1, single, bilateral, 1.5–6 cm long, bearing 4–10 fertile spikelets on each. Rhachis pubescent on surface. Spikelet packing broadside to rhachis, contiguous. Rhachis internodes oblong. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 5–9 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10–20 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture, gaping. Lower glume lanceolate, 6–7 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 5–7 mm long, 0.66–0.75 length of adjacent fertile lemma, coriaceous, 1-keeled, 7 -veined. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 9–10 mm long, coriaceous, keeled, keeled above, 5–7 -veined, more than 3-veined. Lemma surface asperulous, rough above. Lemma apex acuminate, mucronate or awned, 1 -awned. Principal lemma awn 0.5–3 mm long overall. Palea 6–7 mm long. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Anthers 3, 2.5 mm long. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, linear, hairy at apex, apex fleshy. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Basionym or Replaced Name: *Agropyron uncinatum*.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. uncinus*, hook; *-ata*, possessing. Upper glume drawn out into a hook.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Basal innovations intravaginal. Culms erect, 30–80 cm long. Culm-internodes distally glabrous. Culm-nodes pallid or brown. Lateral branches lacking. Leaf-sheaths pubescent or pilose. Ligule an eciliate membrane, 0.5–1 mm long, erose. Leaf-blades involute, 12–25 cm long, 1–2 mm wide. Leaf-blade surface pilose, hairy on both sides.

Inflorescence. Inflorescence composed of racemes. Peduncle 10–25 cm long, pubescent above. Racemes 1, single, bilateral, 2–3 cm long, bearing few fertile spikelets, bearing 3–5 fertile spikelets on each. Rhachis flattened, pubescent on surface, terminating in a barren extension, extension bristle-like, extension 5–6 mm long. Spikelet packing broadside to rhachis. Rhachis internodes linear. Spikelets appressed (anthesis) or spreading to deflexed (fruiting), solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 1 mm long, pubescent.

Fertile Spikelets. Spikelets comprising 4–5 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 15–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes 0.5–1 mm long, pubescent. Floret callus glabrous, disarticulating obliquely.

Glumes. Glumes persistent, similar, shorter than spikelet. Lower glume linear, 7–9 mm long, 1 length of upper glume, coriaceous, 1-keeled, 3 -veined. Lower glume apex acuminate, muticous or awned, 1 -awned, awn 0.5 mm long, awn hooked. Upper glume linear, 7.7–8 mm long, 0.5–0.66 length of adjacent fertile lemma, coriaceous, 1-keeled, 3–5 -veined. Upper glume apex acuminate, muticous or awned, 1 -awned, awn 0.5 mm long (hooked).

Florets. Fertile lemma lanceolate, 12–15 mm long, coriaceous, keeled, 10–14 -veined, more than 3-veined. Lemma lateral veins more or less parallel. Lemma surface pubescent. Lemma apex acuminate, awned, 1 -awned. Principal lemma awn hooked, 1 mm long overall. Palea 7.5–10 mm long. Palea keels ciliate. Palea surface pubescent, hairy on back or on flanks. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 2–2.5 mm long, retained within floret. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Tropical Asia.

Country /Province /State. Malesia, Papuaia. New Guinea PNG. New Guinea.

Australopyrum velutinum (Nees) B.K. Simon. *Austrobaileya*, 2(3): 241 (1986).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. velvety. Plant in whole or in part covered with dense short hairs.

Classification. Subfamily Pooideae. Tribe: Triticeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–40 cm long. Leaf-sheaths pubescent. Ligule an eciliate membrane. Leaf-blades convolute, 5–15 cm long, 2–3 mm wide. Leaf-blade surface pubescent, densely hairy. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes. Peduncle pubescent above. Racemes 1, single, oblong, bilateral, 2.5–3 cm long. Spikelet packing broadside to rhachis, contiguous. Rhachis internodes oblong. Spikelets ascending, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 6–10 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong, laterally compressed, 10 mm long, breaking up at maturity, disarticulating below each fertile floret.

Glumes. Glumes persistent, similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume ovate, 5–6 mm long, 1 length of upper glume, coriaceous, 1-keeled, keeled all along, 7 -veined. Lower glume apex acuminate. Upper glume ovate, 5–6 mm long, 1 length of adjacent fertile lemma, coriaceous, 1-keeled, 9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma ovate, 5–7 mm long, coriaceous, keeled, keeled above, 5 -veined, more than 3-veined. Lemma apex acute, awned, 1 -awned. Principal lemma awn 1–2 mm long overall. Palea keels scabrous. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Ovary with a fleshy appendage below style insertion, pubescent on apex. Caryopsis with adherent pericarp, hairy at apex, apex fleshy. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Tasmania, Victoria. Western Slopes.

Austrochloris dichanthioides (Everist) Lazarides. *Austral. J. Bot.*, Suppl. 5: 35 (1972).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia, Queensland. **Basionym or Replaced Name:** *Chloris dichanthioides* Everist, *Queensland Agric. J.* 49(5): 432, t. 155 (1938). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *W. White 6*, May 1936, Australia: Queensland: Warrego Dist. (US-2830884). HT: *White s.n.*, May 1936, Australia: Queensland: Warrego Dist: Oakwood, N of Charleville (BRI).

Illustrations (Journals): *Austr. J. Bot. (Suppl.5)*: 36, Fig.14 (1972).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Dichanthium*.

Classification. Subfamily Chloridoideae. Tribe: Cynodonteae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–100 cm long, 4–7 -noded. Leaves cauline. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades 5–12 cm long, 3 mm wide. Leaf-blade midrib evident.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, unilateral, 6–12 cm long. Rhachis angular. Spikelet packing regular, 2 -rowed. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 fertile florets, with diminished florets at the apex. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, dorsally compressed, 4.5–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes lower persistent, upper deciduous, dissimilar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume linear, 4.5–5 mm long, 1 length of upper glume, membranous, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex acuminate. Upper glume lanceolate, 4.5–5 mm long, 2 length of adjacent fertile lemma, membranous, without keels, 3 -veined. Upper glume apex acute.

Florets. Fertile lemma ovate, dorsally compressed, 2.5 mm long, coriaceous, without keel, 3 -veined, 0–3 -veined. Lemma midvein pubescent, hairy above. Lemma margins ciliate, hairy above. Lemma apex obtuse, awned, 1 -awned. Principal lemma awn 1.5–3 mm long overall. Apical sterile florets 1 in number, barren, oblong. Apical sterile lemmas winged on margins (above).

Flower and Fruit. Anthers 3, 0.5 mm long. Caryopsis with free soft pericarp, ellipsoid, dorsally compressed, biconvex.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland.

North, Central, South East.

Austroderia fulvida (J. Buch.) N.P.Barker & H.P.Linder. *Ann. Mo. Bot. Gard.* 97 (3): 344 (2010).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (*Cortaderia*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (*Cortaderia*), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (*Cortaderia*).

TYPE from New Zealand. **Basionym or Replaced Name:** *Arundo fulvida* Buchanan *Trans. & Proc. New Zealand Inst.* 6: 242 (1874)

. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Buchanan s.n.*, 1873, New Zealand: Wellington (WELT-59573).

Recent Synonyms: *Cortaderia fulvida* (J. Buch.) Zotov, *N. Zeal.Journ. Bot.* 1: 84 (1963).

Illustrations: None found.

Images: E.Edgar & H.E.Connor, *Flora of New Zealand* 5, *Gramineae* (2000);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Classification. Subfamily Danthonioideae. Tribe: Danthonieae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 150–250 cm long. Ligule a fringe of hairs. Leaf-blades 75–100 cm long, 10–15 mm wide, coriaceous, stiff. Leaf-blade margins scabrous. Gynodioecious ("male", in this context, indicating the bisexual state).

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, dense, nodding, 30–60 cm long. Primary panicle branches drooping. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 10–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, similar to fertile lemma in texture, shiny. Lower glume linear, 10–20 mm long, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear, 10–20 mm long, 1.5 length of adjacent fertile lemma, hyaline, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile florets female. Fertile lemma lanceolate, 7–13 mm long, hyaline, shiny, without keel, 3 -veined, 0–3 -veined. Lemma surface plumose, hairy below. Lemma hairs 5 mm long. Lemma apex entire

or lobed, 2-fid, with filiform lobes, with lobes 0–3 mm long, attenuate, awned, 1-awned. Principal lemma awn apical or from a sinus, 2–7 mm long overall. Palea hyaline, 2-veined. Palea keels ciliolate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, ciliate. Anthers 3, 2 mm long. Caryopsis with adherent pericarp.

Male inflorescence bisexual similar to female, a panicle. Male spikelets resembling female.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I, New Zealand South I.

Classification. Subfamily Danthoioideae. Tribe: Danthoieae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms robust, 200–300 cm long. Ligule a fringe of hairs. Leaf-blades 60–80 cm long, 5–10 mm wide, coriaceous, stiff. Leaf-blade surface glabrous, hairless throughout. Gynodioecious ("male", in this context, indicating the bisexual state).

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, dense, 30–60 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–7 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 20–35 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, similar to fertile lemma in texture, shiny. Lower glume linear, 20–35 mm long, 1 length of upper glume, hyaline, without keels, 1-veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear, 20–35 mm long, 3 length of adjacent fertile lemma, hyaline, without keels, 1-veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile florets female. Fertile lemma lanceolate, 6–15 mm long, 1–3 mm wide, hyaline, shiny, without keel, 3-veined, 0–3-veined. Lemma surface plumose, hairy below. Lemma hairs 6–8 mm long. Lemma apex lobed, 2-fid, with filiform lobes, with lobes 3–7 mm long, attenuate, awned, 1-awned. Principal lemma awn from a sinus, 8–10 mm long overall. Palea hyaline, 2-veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, ciliate. Anthers 3, 2–2.2 mm long. Caryopsis with adherent pericarp, fusiform, 2.5 mm long. Embryo 0.3 length of caryopsis.

Male inflorescence bisexual similar to female, a panicle. Male spikelets resembling female.

Distribution (TDWG). Continent. Australasia (*).

Country /Province /State. Australia (*), New Zealand. Tasmania (*). New Zealand South I.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. shining. Culms glossy.

Classification. Subfamily Danthoioideae. Tribe: Danthoieae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms robust, 300–600 cm long. Leaf-sheaths glabrous on surface or pilose, outer margin glabrous or hairy. Ligule a fringe of hairs. Leaf-blades 200–300 cm long, 30–50 mm wide, firm. Leaf-blade surface scaberulous. Leaf-blade margins scaberulous. Gynodioecious ("male", in this context, indicating the bisexual state).

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, dense, nodding, 75 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 22–50 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, similar to fertile lemma in texture, shiny, gaping. Lower glume linear, 22–50 mm long, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear, 22–50 mm long, 2–5 length of adjacent fertile lemma, hyaline, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile florets female. Fertile lemma lanceolate, 10 mm long, hyaline, shiny, without keel, 3 -veined, 0–3 -veined. Lemma surface plumose, hairy below. Lemma hairs 10 mm long. Lemma apex lobed, 2 -fid, with filiform lobes, with lobes 4–7 mm long, attenuate, awned, 1 -awned. Principal lemma awn from a sinus, 10–15 mm long overall. Palea 6–9 mm long, hyaline, 2 -veined. Palea keels ciliate. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, ciliate. Anthers 3, 3–5 mm long. Caryopsis with adherent pericarp.

Male inflorescence bisexual similar to female, a panicle. Male spikelets resembling female.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. New Zealand North I.

Austroderia toetoe (Zotov) N.P.Barker & H.P.Linder. *Ann. Mo. Bot. Gard.* 97 (3): 344 (2010).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (*Cortaderia*), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (*Cortaderia*).

Recent Synonyms: *Cortaderia toetoe* Zotov, *N. Zeal. Journ. Bot.* 1: 85 (1963).

Illustrations: None found.

Images: R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): Maori, to divide into strips. Maori vernacular name for several grasses.

Classification. Subfamily Danthoioideae. Tribe: Danthoieae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms robust, 400–600 cm long. Leaf-sheaths glabrous on surface. Ligule a fringe of hairs. Leaf-blades 200–300 cm long, 10–30 mm wide, stiff. Leaf-blade surface scabrous, glabrous, hairless except near base. Leaf-blade margins scabrous. Gynodioecious ("male", in this context, indicating the bisexual state).

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, dense, equilateral, 60–100 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 15–24 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, similar to fertile lemma in texture, shiny, gaping. Lower glume linear, 15–24 mm long, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower

glume lateral veins absent. Lower glume apex setaceously acuminate. Upper glume linear, 15–24 mm long, 2–2.5 length of adjacent fertile lemma, hyaline, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume apex setaceously acuminate.

Florets. Fertile florets female. Fertile lemma lanceolate, 8–9 mm long, hyaline, shiny, without keel, 3 -veined, 0–3 -veined. Lemma surface plumose, hairy below. Lemma hairs 8–9 mm long. Lemma apex lobed, 2 -fid, with filiform lobes, with lobes 3–7 mm long, attenuate, awned, 1 -awned. Principal lemma awn from a sinus, 10 mm long overall. Palea 5–6.5 mm long, hyaline, 2 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, cuneate, fleshy, ciliate. Anthers 3, 2–4 mm long. Caryopsis with adherent pericarp.

Male inflorescence bisexual similar to female, a panicle. Male spikelets resembling female.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia (*), New Zealand. New Zealand North I.

Austroderia turbaria (H.E. Connor) N.P.Barker & H.P.Linder. *Ann. Mo. Bot. Gard.* 97 (3): 344 (2010).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (*Cortaderia*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006) (*Cortaderia*), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000) (*Cortaderia*).

TYPE from New Zealand. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: New Zealand: Rakeinui, east end of Lake, Chatham Island, 24 Feb 1985, D.R. Given 13899 (HT: CHR-417471).

Recent Synonyms: *Cortaderia turbaria* H.E. Connor, *New Zealand J. Bot.*, 25(1): 167 (1987).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Middle English *turbary*, medieval L. *turbaria*, peat-bog or peat-moss. Occuring in peat-bog.

Classification. Subfamily Danthoioideae. Tribe: Danthoieae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms robust, 100–200 cm long. Leaf-sheaths hirsute. Ligule a fringe of hairs. Leaf-blades 50–100 cm long, 5–10 mm wide, firm. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–30 cm long. Panicle branches hirsute. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, ciliate.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with diminished florets at the apex. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent.

Glumes. Glumes similar, exceeding apex of florets, similar to fertile lemma in texture, shiny, gaping. Lower glume linear, 20 mm long, 1 length of upper glume, hyaline, without keels, 1 -veined. Lower glume lateral veins absent. Lower glume surface hirsute. Lower glume apex setaceously acuminate. Upper glume linear, 20 mm long, 3–4 length of adjacent fertile lemma, hyaline, without keels, 1 -veined. Upper glume lateral veins absent. Upper glume surface hirsute. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, 5–7 mm long, hyaline, without keel, 3 -veined, 0–3 -veined. Lemma surface hirsute. Lemma apex lobed, 2 -fid, with lobes 0.5–1 mm long. Palea 5–7 mm long, hyaline, 2 -veined. Apical sterile florets resembling fertile though underdeveloped.

Flower and Fruit. Lodicules 2, fleshy. Anthers 3, 2–5 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. New Zealand. Chatham Is.

Austrostipa acrociliata (Reader) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 584 (1996).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa acrociliata* Reader, *Victoria Naturalist* 13: 167 (1897). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Reader s.n.*, 1895, Australia: Victoria: Sandy Desert, Lowan Shire (MEL-59867; IT: MEL-59869?, MEL-59868).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (69, Fig. 30), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (382, Fig. 75), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,, *Grasses of New South Wales*, 4th edn (2008) (151), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (31, Fig. 4), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): Gk. *akros*, at the tip; L. *cilium*, hair; -ata, possessing. Glume apices hairy.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Cataphylls evident. Rhizomes short, woody. Culms robust, 60–150 cm long, woody. Culm-internodes glaucous, distally glabrous. Culm-nodes glabrous. Ligule an eciliate membrane, 4–5 mm long. Leaf-blades 3–8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 20–40 cm long. Primary panicle branches appressed, 8–15 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 7–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume oblong, 7–10 mm long, 1.2–1.3 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume lateral veins all extending to apex. Lower glume margins ciliate. Lower glume apex obtuse. Upper glume oblong, 6–8 mm long, membranous, with hyaline margins, without keels, 3 -veined. Upper glume lateral veins all extending to apex. Upper glume margins ciliate. Upper glume apex obtuse.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, limb subterete below, 60–80 mm long overall, with twisted column. Column of lemma awn 7–10 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, South Australia, Victoria, Western Australia. Ereman, South-West. Southern. Western Plains.

Austrostipa aphylla (Rodway) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 584 (1996).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa aphylla* (Rodway) Townrow, *Pap. & Proc. Roy. Soc. Tasmania* 104: 85, 96 (1970). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Rodway* 995, Nov 1897, Australia: Tasmania: Huon Road, Hobart (HO). LT designated by Vickery, Jacobs & Everett, *Telopea* 3: 27 (1986).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (55, Fig. 8), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): Gk. a-, without; phyllon, leaf. The leaves lack blades.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, slender, 50–90 cm long, 0.5–1 mm diam., 3–4 -noded. Culm-nodes pubescent. Leaf-sheaths deciduous, 0.4–1.8 cm long, glabrous on surface. Ligule a ciliate membrane, 0.1 mm long. Leaf-blades deciduous at the ligule (when inflorescence emerges), involute, 2–4.5 cm long, 1 mm wide, stiff. Leaf-blade surface ribbed.

Inflorescence. Inflorescence a panicle, comprising 30 fertile spikelets. Panicle open, lanceolate, 17 cm long, 3 cm wide. Primary panicle branches appressed. Panicle axis scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–20 mm long, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13.5–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.6–2.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume linear, 13.5–15 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex attenuate. Upper glume linear, 12.5–15 mm long, membranous, without keels, 3–5 -veined. Upper glume apex attenuate.

Florets. Fertile lemma linear, subterete, 8–11 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface papillose, pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 60–70 mm long overall, with twisted column, limb puberulous. Column of lemma awn 40–51 mm long, puberulous. Palea 5.2–7 mm long, 0.8–1 length of lemma, without keels. Palea surface puberulous.

Flower and Fruit. Lodicules 3, 1.5 mm long. Anthers 3, 2.5–5.1 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Tasmania.

Austrostipa aquarii (Vickery, S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 584. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa aquarii* Vickery, S.W.L. Jacobs & J. Everett, *Telopea* 3(1): 27 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Northern Territory: Waterhouse range, 24.02S, 133.36E, 3 Feb. 1976. Erect perennial, rare in skeletal soil, walls of gully, sand, *Latz 6349* (HT: NT).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (18, Fig.2A), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. aquarius*, water man. From the Waterhouse Range, Northern Territory, Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms 50–100 cm long, 1.5 mm diam., 5–6 -noded. Culm-internodes distally glabrous or pubescent. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths antrorsely scabrous, glabrous on surface or hirsute, outer margin glabrous or hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 1–2 mm long, pubescent on abaxial surface, obtuse. Leaf-blades convolute, 30–60 cm long, 1–2 mm wide. Leaf-blade surface ribbed, scabrous, rough abaxially, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 14–20 cm long, 1 cm wide. Primary panicle branches 1–3 cm long. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–4 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, curved, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume primary vein scaberulous. Lower glume apex acuminate. Upper glume lanceolate, 9–10 mm long, hyaline, without keels, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3.5–5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above, pilose, hairy below. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 40–50 mm long overall, with twisted column, limb limb ciliate, glabrescent towards tip. Middle segment of lemma awn 3–4 mm long, hirtellous. Column of lemma awn 7–9 mm long, hirtellous, with 0.8–1.3 mm long hairs. Palea 0.9 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 2, 0.7 mm long. Anthers 3, 0.8 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory. Central Australia.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. arista*, bristle; *gluma*, husk. With awned subtending glumes or lemmas.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–200 cm long, 2.5 mm diam., 3-noded. Culm-internodes distally glabrous or pubescent. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths ribbed, smooth or scaberulous, outer margin hairy. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 0.8–3 mm long, truncate or obtuse. Leaf-blades flat or convolute, 20–40 cm long, 3–6 mm wide. Leaf-blade surface smooth or scaberulous, rough adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, 20–40 cm long, 6–10 cm wide. Primary panicle branches 10–20 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 6–12 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.4–1 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 8–14 mm long, 1 length of upper glume, membranous, without keels, 3-veined. Lower glume surface smooth or asperulous, rough generally or on veins. Lower glume apex attenuate or setaceous acuminate. Upper glume oblong, 6–12 mm long, membranous, without keels, 5-veined. Upper glume surface smooth or asperulous, rough generally or on veins. Upper glume apex attenuate or setaceous acuminate.

Florets. Fertile lemma elliptic, subterete, 4–7.5 mm long, coriaceous, light brown or dark brown, without keel, 5-veined, more than 3-veined. Lemma surface pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex surmounted by a ring of hairs, awned, 1-awned. Principal lemma awn bigeniculate, 25–40 mm long overall, with twisted column. Middle segment of lemma awn 6–8 mm long. Column of lemma awn 4–9 mm long. Palea 1 length of lemma, 2-veined, without keels.

Flower and Fruit. Lodicules 3, 0.5–1.8 mm long. Anthers 3, 2–3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3–4.5 mm long. Embryo 0.33–0.5 length of caryopsis. Hilum linear, 0.75–0.9 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. bis*, twice; *geniculata*, kneed. Awn of lemma bent in two places.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths pubescent. Culms erect, 20–50 cm long, 2–4 -noded. Culm-nodes pubescent. Leaf-sheaths 1.5–3 cm long, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.4–0.5 mm long. Leaf-blades filiform, convolute, 20–45 cm long, 1–2 mm wide. Leaf-blade surface ribbed, scabrous, rough adaxially, glabrous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–25 cm long, 1–3 cm wide. Primary panicle branches 3–6 cm long, bearing 1–10 fertile spikelets on each lower branch. Panicle axis scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 5–10 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.7–3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 15–20 mm long, 1.1–1.4 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 13–14 mm long, membranous, without keels, 5 -veined. Upper glume surface puberulous, hairy above. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7.3–10.5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface scaberulous, rough above, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs yellow or tawny. Lemma apex surmounted by a ring of hairs, with this appendage 2.2–4.4 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 40–50 mm long overall, with twisted column, limb puberulous. Column of lemma awn 20–25 mm long, puberulous. Palea 5–7 mm long, 0.9 length of lemma, without keels. Palea surface puberulous.

Flower and Fruit. Lodicules 3, 2.4 mm long. Anthers 3, 3.3–4.4 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand (*). New South Wales, A.C.T., Tasmania, Victoria. New Zealand South I.

Coast, Tablelands, Western Slopes, Western Plains.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor John McConnell Black (1855–1951) Scots-born South Australian botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 100 cm long, 1.5–2.5 mm diam., 3–4 -noded. Culm-internodes distally glabrous or pubescent. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths scaberulous, pubescent, outer margin hairy. Leaf-sheath

oral hairs pubescent. Ligule a ciliolate membrane, 0.3–1.5 mm long, pubescent on abaxial surface, truncate. Leaf-blades flat or involute, 10–20 cm long, 2–5 mm wide. Leaf-blade surface ribbed, scabrous, rough on both sides, pubescent, hairy abaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, 10–30 cm long, 2–6 cm wide. Primary panicle branches 2–8 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, terete or angular, 5–13 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1.2–2.3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 10–17 mm long, 1.2 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface smooth or scabrous. Lower glume margins eciliate or ciliate. Lower glume apex acuminate. Upper glume oblong, 8–15 mm long, membranous, without keels, 4–5 -veined. Upper glume surface smooth or asperulous. Upper glume apex acuminate.

Florets. Fertile lemma oblanceolate, subterete, gibbous, 5–7 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface pilose, hairy on veins. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex scabrous, surmounted by a ring of hairs, with this appendage 2–3 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 28–40 mm long overall, with twisted column. Middle segment of lemma awn 7–10 mm long. Column of lemma awn 6–10 mm long. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3, 2.3–3.5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3.4–3.8 mm long. Embryo 0.33–0.5 length of caryopsis. Hilum linear, 0.9 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Derivation (Clifford & Bostock 2007): in honor of Stanley Thatcher Blake (1911–1973), Queensland botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Butt sheaths pubescent. Culms 30–100 cm long, 1–2 mm diam., 2–4 -noded. Culm-internodes distally glabrous or pubescent. Culm-nodes swollen, glabrous. Lateral branches lacking. Leaf-sheaths glabrous on surface or puberulous, outer margin glabrous or hairy. Leaf-sheath oral hairs scanty or lacking. Ligule a ciliolate membrane, 1–2.5 mm long, truncate. Leaf-blades involute, 15–28 cm long, 1.5–2 mm wide. Leaf-blade surface ribbed, pubescent, hairy abaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 20–35 cm long, 2–3 cm wide. Primary panicle branches 3–6 cm long. Panicle axis glabrous or puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 7–25 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 14–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, straight, 2.5–3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 14–18 mm long, 1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 13–17 mm long, hyaline, without keels, 5 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 7–8 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface papillose, puberulous. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, with lobes 0.1–0.2 mm long, awned, 1 -awned. Principal lemma awn from a sinus, geniculate, recurved at base of limb, 70–100 mm long overall, with twisted column. Column of lemma awn 9–13 mm long, pubescent, with 0.2–0.3 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back.

Florets and Fruit. Lodicules 2, 2 mm long. Anthers 3, 3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 4.5 mm long. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland. Central, Inland.

Austrostipa breviglumis (J.M. Black) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 584. 1996.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. brevis*, short; *gluma*, husk. One or both glumes short with respect to the length of the spikelet.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths distinctly ribbed. Culms erect or geniculately ascending, 150 cm long, 2.5 mm diam., 2–4 -noded. Culm-nodes swollen, glabrous. Lateral branches ample. Leaves cauline. Leaf-sheaths loose or inflated, scaberulous, glabrous on surface. Ligule an eciliate membrane, 1–7 mm long, truncate. Leaf-blades flat or involute, 10–20 cm long, 2–2.5 mm wide. Leaf-blade surface ribbed, scabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20–40 cm long, 2–4 cm wide. Primary panicle branches 5–10 cm long. Panicle axis angular, glabrous or puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 5–6.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 0.5 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 5.5–6.5 mm long, 1 length of upper glume, hyaline, without keels, 3–5 -veined. Lower glume surface puberulous. Lower glume apex acute or acuminate. Upper glume lanceolate, 4.5–6 mm long, hyaline, without keels, 3 -veined. Upper glume surface puberulous. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 3–4.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 0.2–0.4 mm long. Lemma apex with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 0.2 mm long (as to hairs), awned, 1 -awned. Principal lemma awn geniculate or bigeniculate,

20–35 mm long overall, with twisted column. Middle segment of lemma awn 5–8 mm long. Column of lemma awn 5–6.5 mm long. Palea 0.5–0.6 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3, 1.25 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms 90–150 cm long. Leaf-sheaths glabrous on surface, outer margin glabrous or hairy. Leaf-sheath auricles erect. Ligule an eciliate membrane or absent, 0–1(–2) mm long. Leaf-blades erect, filiform, involute or convolute, 35–45 cm long, 0.5–0.8 mm wide, stiff. Leaf-blade surface ribbed, grooved adaxially, pubescent, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 25–30 cm long, 3–4 cm wide. Primary panicle branches 8–12 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–13 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1.5–1.8 mm long, pubescent, acute. Floret callus hairs 0.4–1 mm long (tawny).

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 11–13 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 11–12 mm long, membranous, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7–8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs tawny, 0.5–0.6 mm long. Lemma apex dentate, 2 -fid, with lobes 0.3–1 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 42–55 mm long overall, with twisted column. Middle segment of lemma awn 8–9 mm long. Column of lemma awn 11–12 mm long, puberulous, with 0.2–0.4 mm long hairs. Palea 1 length of lemma, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 3, ovate, 1–1.2 mm long. Anthers 3, 4.2–5 mm long, anther tip penicillate. Caryopsis with adherent pericarp, fusiform, 4.1–4.6 mm long. Embryo 0.25 length of caryopsis. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 60–80 cm long, 1–2 mm diam., 2–4 -noded. Culm-internodes terete, distally pubescent. Culm-nodes swollen, pubescent. Leaf-sheaths tight, mostly shorter than adjacent culm internode, ribbed, pubescent to hirsute, outer margin hairy. Leaf-sheath auricles absent or erect. Ligule a ciliolate membrane, 0.3–0.6 mm long, truncate. Leaf-blades convolute, 15–35 cm long, 1.5–2 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially, pubescent to hirsute, hairy on both sides. Leaf-blade margins ciliate. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear or lanceolate, 10–20 cm long, 2–3 cm wide. Primary panicle branches 2–3 cm long. Panicle axis scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 2–10 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–2.5 mm long, pubescent, acute. Floret callus hairs 0.2–0.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 15–23 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 14–18 mm long, membranous, without keels, 5 -veined. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 8–9 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent or pilose. Lemma margins convolute, covering most of palea. Lemma hairs 0.3–1 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 50–70 mm long overall, with twisted column, limb scaberulous. Middle segment of lemma awn 10 mm long. Column of lemma awn 20 mm long, pubescent to hirsute, with 0.3–1.6 mm long hairs. Palea 1 length of lemma, without keels.

Flower and Fruit. Lodicules 2, 1.6–1.8 mm long. Anthers 3, 2.5–3.5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 4–5 mm long. Embryo 0.2 length of caryopsis. Hilum linear, 0.8–1 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Derivation (Clifford & Bostock 2007): *L. centrum*, centre of a circle; *-ale*, pertaining to. From Central Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Butt sheaths woolly. Basal innovations extravaginal. Culms 40–80 cm long, 1 mm diam., 4–5 -noded. Culm-internodes smooth. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths tight, glabrous on surface or puberulous. Ligule an eciliate membrane, 0.6–1 mm long, scarious, pubescent on abaxial surface, acute. Leaf-blades involute, 10–25 cm long, 1.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially. Leaf-blade margins smooth or scaberulous.

Inflorescence. Inflorescence a panicle, comprising 10–30 fertile spikelets. Panicle open, 10–20 cm long, 1–2.5 cm wide, bearing few spikelets. Primary panicle branches 1.5–4 cm long. Panicle axis

scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–25 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 13–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume elliptic, 13–18 mm long, 1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume surface puberulous, hairy below. Lower glume apex acuminate. Upper glume elliptic, 12–16 mm long, hyaline, without keels, 5 -veined. Upper glume surface puberulous, hairy below. Upper glume apex acuminate.

Florets. Fertile lemma oblanceolate, subterete, 5–9 mm long, coriaceous, light brown or dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface granulose, glabrous. Lemma margins convolute, covering most of palea. Lemma apex entire or dentate, 2 -fid, with lobes 0.3 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 50–60 mm long overall, with twisted column. Middle segment of lemma awn 7–12 mm long. Column of lemma awn 12–13 mm long, pubescent, with 0.25–0.4 mm long hairs. Palea 0.9 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back.

Flower and Fruit. Lodicules 2 or 3, 1 mm long. Anthers 3, 0.8–1.5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Derivation (Clifford & Bostock 2007): *L. comprimo*, squeeze together. Culms flattened.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Annual, caespitose. Butt sheaths glabrous. Culms 20–45 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 10 mm long, erose or bilobed or trilobed. Leaf-blades filiform or linear, involute, 1–2 mm wide, firm.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, 20 cm long. Primary panicle branches whorled at most nodes. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 10–15 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 13 mm long, 1.5 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume lanceolate, 9 mm long, membranous, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 7–8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 70–170 mm long overall, with twisted column, limb pubescent. Column of lemma awn pubescent. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia.

Derivation (Clifford & Bostock 2007): L. with long hair. Hairy as of leaf-blades or awns invested in long weak hairs.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–80 cm long. Culm-internodes smooth or scaberulous. Ligule a ciliate membrane. Leaf-blades filiform, involute, 1–2 mm wide. Leaf-blade surface glabrous or pubescent.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner above, without keels, 3 - veined. Lower glume primary vein scabrous. Lower glume lateral veins obscure. Lower glume apex acuminate. Upper glume lanceolate, 12 mm long, membranous, with hyaline margins, without keels, 5 - veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 - awned. Principal lemma awn geniculate, ascending (straight), 40 mm long overall, with twisted column. Column of lemma awn 11 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. Eremean.

Austrostipa curticoma (Vickery) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

TYPE from Australia. **Basionym or Replaced Name:** *Stipa curticoma* Vickery, *Telopea* 2(1): 11 (1980). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: South Australia: Mt. Lofty Ranges, 3 km S of Mt. Barker, 13 Oct 1974, *M.D. Crisp* 884 (CBG-058899).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (82, Fig. 43), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (392, Fig. 78 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. *curtus*, short; *coma*, hair-tuft. With a short tuft of hairs at the apex of the lemma.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 60–120 cm long, 2–3 mm diam., 3–4 - noded. Culm-internodes distally glabrous. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths glabrous on surface or puberulous, outer margin hairy. Leaf-sheath oral hairs ciliate, 1 mm long. Ligule a ciliate membrane, 0.5–1.5 mm long, pubescent on abaxial surface, truncate. Leaf-blades flat or involute, 15–30 cm long, 3–5 mm wide. Leaf-blade surface ribbed, scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, 15–30 cm long, 5–7 cm wide. Primary panicle branches spreading, 5–10 cm long. Panicle axis smooth or scabrous, with scattered hairs. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 4–16 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 12–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1.5–2.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 12–16 mm long, 1.1–1.3 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface asperulous, rough generally or on veins. Lower glume apex acuminate. Upper glume oblong, 9–14 mm long, membranous, without keels, 5 -veined. Upper glume surface asperulous, rough generally or on veins. Upper glume apex acuminate.

Florets. Fertile lemma oblong, subterete, 6.5–8 mm long, coriaceous, dark brown or black, without keel, 5 -veined, more than 3-veined. Lemma surface granulose, pilose. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, with lobes 0.1–0.5 mm long, with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 0.5–1 mm long (as to hairs), awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 45–65 mm long overall, with twisted column. Middle segment of lemma awn 9–14 mm long. Column of lemma awn 9–11 mm long, pubescent, with 0.25–0.5 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 1–2 mm long. Anthers 3, 3–3.5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 4 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.9 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, Victoria. Southern.

Austrostipa densiflora (Hughes) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

TYPE from Australia. **Basionym or Replaced Name:** *Stipa congesta* Summerh. & C.E. Hubb., *Bull. Misc. Inform. Kew* 1925: 362 (1927). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Etheridge s.n.*, 1865, Australia: South Victoria (K).

Recent Synonyms: *Stipa densiflora* D.K.Hughes, *Kew Bull.* 1921, 18. (1921).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (101, Fig. 63), N.Walsh & T.Entwistle, *Flora of Victoria Vol 2* (1994) (398, Fig. 79 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (18, Fig. 2), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (152), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. densus*, dense; *flos*, flower. Inflorescences congested.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms 60–100 cm long. Culm-nodes pubescent. Leaf-sheaths pubescent. Ligule a ciliolate membrane. Leaf-blades convolute, 6–13 cm long, 1–2 mm wide. Leaf-blade surface pubescent, hairy on both sides. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, elliptic or oblong, 10–20 cm long, 2–4 cm wide. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface pubescent. Lower glume apex acuminate. Upper glume lanceolate, 14–16 mm long, membranous, without keels, 3 -veined. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn geniculate, 30–38 mm long overall, with twisted column, limb hirsute, with 1 mm long hairs. Column of lemma awn 16–18 mm long, hirsute, with 1 mm long hairs. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, A.C.T., Queensland, South Australia, Tasmania.

Southern. South East. Coast, Tablelands, Western Slopes.

Austrostipa dongicola (Vickery, S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa dongicola* Vickery, S.W.L. Jacobs & J. Everett, *Telopea* 3(1): 46 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Western Australia: Blackoak Donga, Kanandah Station, ca. 20 km N of Naretha Donga, 16 Sep 1974, *M.G. Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. *-cola*, dweller. Growing in shallow gullies, that is dongas (from Zulu, udonga) in Western Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms 100 cm long, 1.3–2.2 mm diam., 3–4 -noded. Culm-internodes distally pubescent. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths loose, glabrous on surface. Ligule an eciliate membrane, 0.8–1.5 mm long, pubescent on abaxial surface, truncate or obtuse. Leaf-blades straight or flexuous, flat or involute, 15–35 cm long, 3–4 mm wide. Leaf-blade surface pubescent, hairy on both sides.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, 14–30 cm long, 1–6 cm wide. Primary panicle branches 2–5 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–11 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 7–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume oblong, 7–12 mm long, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume apex acuminate. Upper glume oblong, 8–11 mm long, membranous, purple, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma oblong, subterete, 5–6.5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface scabrous, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white or yellow. Lemma apex with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 0.7 mm long (as to hairs), awned, 1 -awned. Principal lemma awn bigeniculate, 30–40 mm long overall, with twisted column. Middle segment of lemma awn 5 mm long. Column of lemma awn 10 mm long, hirtellous, with 0.5–1.5 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 0.4–0.6 mm long. Anthers 3, 3.5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3–3.5 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. Eremean.

Austrostipa drummondii (Steud.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa drummondii* Steud., *Syn. Pl. Glumac.* 1: 128 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: *Drummond IV 378 [as 578]* see Vickery et al., *Telopea* 3: 47 (1986) for discussion about the type collection misattribution.

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (72, Fig. 33), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (386, Fig. 76 as *Stipa*), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler, *Grasses of New South Wales*, 4th edn (2008) (153), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (44, Fig. 6), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of James Drummond (c. 1784–1863) Scots-born Australian botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long, compressible. Lateral branches lacking. Leaf-sheaths loose, smooth or antrorsely scabrous. Ligule an eciliate membrane, 2–4 mm long, obtuse. Leaf-blades involute, 1–2 mm wide, stiff. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, 15–30 cm long. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–6 mm long, tip widened.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, dissimilar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9 mm long, 1.2 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex entire or dentate, 2–3 -fid, obtuse. Upper glume lanceolate, 7–8 mm long, membranous, much thinner above, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 45–60 mm long overall, with twisted column. Column of lemma awn 13 mm long, pubescent. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales, South Australia, Victoria, Western Australia. Eremean, South-West. Southern. Tablelands, Western Slopes, Western Plains.

Austrostipa echinata (Vickery, S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa echinata* Vickery, S.W.L. Jacobs & J. Everett, *Telopea* 3(1): 50 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Australia: Hindmarsh I., E of Goolwa, 10 Oct 1945, *F.M. Hilton s.n.* (HT: NSW-117382).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (92, Fig. 54), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (31, Fig. 4), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. spiny. Plants forming spiny tussocks.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50 cm long, 1.5–2 mm diam., 3–4 -noded. Culm-internodes estriate or ridged. Culm-nodes flush with internodes, pubescent. Lateral branches lacking. Leaf-sheaths tight, ribbed, glabrous on surface, outer margin hairy. Leaf-sheath auricles erect, 1–3.5 mm long. Ligule an eciliate membrane or a ciliolate membrane, 1.5–2.5 mm long, pubescent on abaxial

surface, truncate or obtuse. Leaf-blades erect, convolute, 7–15 cm long, 1–2 mm wide, stiff. Leaf-blade surface ribbed, scaberulous, rough adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–20 cm long, 1.5–3 cm wide. Primary panicle branches 1.5–2.5 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 2–10 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 21–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.6–3.2 mm long, pubescent, acute. Floret callus hairs 0.1–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 21–23 mm long, 1.3–1.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface smooth to scabrous. Lower glume apex acute or acuminate. Upper glume lanceolate, 14–18 mm long, membranous, without keels, 5 -veined. Upper glume surface smooth to scabrous. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 8–10 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface smooth or granulose, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white or yellow, 0.4–0.7 mm long. Lemma apex dentate, 2 -fid, with lobes 0.2–0.7 mm long, surmounted by a ring of hairs, with this appendage 0.6–1.2 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 90–110 mm long overall, with twisted column. Middle segment of lemma awn 15–20 mm long. Column of lemma awn 10–20 mm long, pubescent, with 0.2–0.8 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 2, 1–1.5 mm long. Anthers 3, 3.2–3.8 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3 mm long. Embryo 0.15 length of caryopsis. Hilum linear, 0.7 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia. Southern.

Austrostipa elegantissima (Labill.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa elegantissima* Labill., *Nov. Holl. Pl.* 1: 23, t. 29 (1804 [1805]). Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. elegans*, elegant; -*issima*, most. Very attractive in some respect, usually the inflorescence.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms rambling or scandent, 200–300 cm long. Culm-nodes glabrous. Lateral branches ample. Leaf-sheaths scaberulous, glabrous on surface. Ligule an eciliate membrane, 3–5 mm long, lacerate. Leaf-blades involute, 1–2 mm wide.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, 15–25 cm long. Primary panicle branches whorled at most nodes, branching divaricately. Panicle branches plumose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, plumose.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 0.75–0.85 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface pubescent. Lower glume apex acuminate. Upper glume lanceolate, 8–10 mm long, membranous, without keels, 3 -veined. Upper glume surface pubescent. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface scabrous, rough above, pubescent, hairy at base. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 30–55 mm long overall, with twisted column. Column of lemma awn 15 mm long, plumose. Palea 2 mm long, 0.25 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Derivation (Clifford & Bostock 2007): Gk. *eremos*, desert; *phileo*, love. Desert species.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Culms erect or geniculately ascending, 60–100 cm long. Culm-nodes pubescent. Leaf-sheaths glabrous on surface or pubescent. Ligule an eciliate membrane or a ciliolate membrane. Leaf-blades convolute, 25–55 cm long, 2–3 mm wide. Leaf-blade surface glabrous or pubescent. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, 15–30 cm long. Primary panicle branches 4–9 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–8 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 13–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 13–17 mm long, membranous, with hyaline margins, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 10 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs tawny. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 65–70 mm long overall, with twisted column. Column of lemma awn 25–30 mm long, puberulous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. slender. Culms slender.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 40 cm long, 2-noded. Culm-internodes scaberulous or antrorsely scabrous, distally glabrous. Culm-nodes pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths tight, wider than blade at the collar, striately veined, antrorsely scabrous, pubescent, outer margin hairy. Leaf-sheath oral hairs lacking or ciliate. Ligule an eciliate membrane, 0.5 mm long, obtuse. Leaf-blades filiform, convolute, 5–25 cm long, 0.5 mm wide. Leaf-blade surface scabrous, puberulous to hirsute, hairy on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, 5–15 cm long, bearing few spikelets. Primary panicle branches ascending. Panicle axis smooth or scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 8–11 mm long, 1.1–1.3 length of upper glume, hyaline, without keels, 3 -veined. Lower glume surface scabrous. Lower glume apex acuminate. Upper glume lanceolate, 7–8 mm long, hyaline, without keels, 5 -veined. Upper glume surface scabrous. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 4.5–5.5 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface scaberulous, pubescent. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight or bigenulate, 38–55 mm long overall, with twisted column. Palea 1 length of lemma, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, Victoria. South-West. Southern.

Austrostipa feretacea (Vickery, S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa feretacea* Vickery, S.W.L. Jacobs & J. Everett. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Australia: Northern Territory: Mount Giles, 23.39S 132.55E, 19 Sep 1976, spreading perennial, rare in skeletal soil, side of gully in shistose [shistose] hill, P.K. Latz 6605 (HT: NT-5110; IT: NSW).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (44, Fig. 6), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (154), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. *ferē*, nearly. Similar to *Stipa setacea*.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 50–100 cm long, 0.4–1.2 mm diam., compressible, 3-noded. Culm-internodes striate or ridged, smooth or scaberulous. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths ribbed, smooth or scaberulous, outer margin glabrous. Ligule an eciliate membrane, 3.5–8 mm long, acute or acuminate. Leaf-blades convolute, 15–30 cm long, 0.7–0.9 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially, puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 6–12 cm long, 0.5–1 cm wide. Primary panicle branches 0.1–2.5 cm long. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 2–7 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4–7 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 0.7–1.4 mm long, pubescent, acute. Floret callus hairs 0.1–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 4–7 mm long, 1 length of upper glume, membranous, without keels, 3-veined. Lower glume surface smooth or asperulous. Lower glume apex acute. Upper glume lanceolate, 4–6 mm long, membranous, without keels, 3–5-veined. Upper glume surface smooth or asperulous. Upper glume apex acute.

Florets. Fertile lemma oblanceolate, subterete, 3–4.5 mm long, coriaceous, without keel, 5-veined, more than 3-veined. Lemma surface smooth or granulose, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 0.5–1 mm long. Lemma apex awned, 1-awned. Principal lemma awn bigeniculate, 12–18 mm long overall, with twisted column. Middle segment of lemma awn 3–4 mm long. Column of lemma awn 3.5–6 mm long. Palea 1 length of lemma, 2-veined, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 3, 0.5–0.8 mm long. Anthers 3, 1.4–1.8 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp, 2–2.5 mm long. Embryo 0.3–0.4 length of caryopsis. Hilum linear, 0.8–1 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Northern Territory. Central Australia.

Austrostipa flavescens (Labill.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 585. 1996.

Derivation (Clifford & Bostock 2007): *L. flavescens*, become yellow. Spikelets yellowish.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths grey, pubescent. Culms erect or geniculately ascending, robust, 40–80 cm long, 3–4-noded. Culm-nodes pubescent. Leaf-sheaths glabrous on surface, outer margin glabrous or hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.5 mm long, truncate. Leaf-blades convolute, 9–54 cm long, 2–5 mm wide, stiff. Leaf-blade surface scaberulous, rough adaxially, glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–30 cm long, 2 cm wide. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–12 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9.8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.1–3.5 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 9.8–15 mm long, 1.1–1.2 length of upper glume, hyaline, without keels, 3 -veined. Lower glume primary vein scaberulous. Lower glume lateral veins prominent. Lower glume surface puberulous. Lower glume apex acuminate. Upper glume lanceolate, 8.5–12 mm long, hyaline, without keels, 5 -veined. Upper glume primary vein scaberulous. Upper glume lateral veins prominent. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 7.5–12 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface papillose, rough above, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs red. Lemma apex entire or dentate, 2 -fid, with lobes 0.1–0.6 mm long, surmounted by a ring of hairs, with this appendage 0.5–1.3 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 50–60 mm long overall, with twisted column. Column of lemma awn 17–30 mm long, puberulous. Palea 4.5–6.5 mm long, 0.8 length of lemma, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 3, 2–2.5 mm long. Anthers 3, 0.8–1.9 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand (*). Western Australia, South Australia, New South Wales, Victoria, Tasmania. New Zealand South I. Eremean, South-West. Southern. Coast.

Derivation (Clifford & Bostock 2007): In honor of Geoffrey Thomas Jacobs (1980-) Australian Information Technologist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 100–180 cm long, 2–4 mm diam., 3 -noded. Culm-internodes terete, distally glabrous. Culm-nodes swollen. Leaf-sheaths loose, ribbed, smooth, puberulous, outer margin glabrous. Ligule an eciliate membrane, 6–12 mm long, acute. Leaf-blades convolute, 50–100 cm long, 2–3 mm wide. Leaf-blade surface scaberulous, rough adaxially, glabrous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 30–40 cm long, 3–5 cm wide. Primary panicle branches 6–12 cm long. Panicle axis glabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–13 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–16 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–15 mm long, membranous, yellow, 1-keeled, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 12–16 mm long, membranous, yellow, 1-keeled, 3 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 9–12 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs white, 1–1.5 mm long. Lemma apex dentate, 2 -fid, with lobes 2.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 50–80 mm long overall, with twisted column. Middle segment of lemma awn 5–10 mm long. Column of lemma awn 5–10 mm long. Palea 1 length of lemma, without keels. Palea surface pubescent, hairy on back. Palea apex dentate, 3–4 -fid.

Flower and Fruit. Lodicules 2, 1–2 mm long. Stigmas 2.
Distribution (TDWG). Continent. Australasia.
Country /Province /State. Australia. Western Australia.
South-West.

Austrostipa gibbosa (Vickery) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 586. 1996.

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (83, Fig. 44), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (392, Fig. 78 as *Stipa*), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler, *Grasses of New South Wales*, 4th edn (2008) (154), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. gibba*, swelling; *-osa*, indicating abundance. Spikelets swollen asymmetrically.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 100–150 cm long, 1.5–2.5 mm diam., 2–3 -noded. Culm-internodes smooth or scaberulous. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths ribbed, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long, pubescent on abaxial surface, truncate. Leaf-blades flat or convolute, 15–30 cm long, 2–5 mm wide. Leaf-blade surface ribbed, pubescent, hairy abaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–30 cm long, 1.5–2 cm wide. Primary panicle branches 4–9 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 4–10 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 1–1.5 mm long, pubescent, truncate.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume elliptic, 11–17 mm long, 1.3–1.4 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface scabrous, rough generally or on veins. Lower glume apex acute or acuminate. Upper glume elliptic, 8–13 mm long, membranous, without keels, 5 -veined. Upper glume surface scabrous, rough generally or on veins. Upper glume apex acute or acuminate.

Florets. Fertile lemma oblong, subterete, gibbous, 4.5–6 mm long, coriaceous, dark brown to black, without keel, 5 -veined, more than 3-veined. Lemma surface granulate, pilose. Lemma margins convolute, covering most of palea. Lemma hairs white or yellow. Lemma apex surmounted by a ring of hairs, with this appendage 0.8–1.3 mm long, awned, 1 -awned. Principal lemma awn eccentric, bigenulate, 25–35 mm long overall, with twisted column. Middle segment of lemma awn 1–12 mm long. Column of lemma awn 5–8 mm long. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3, 0.5–1.3 mm long. Anthers 3, 2.5–3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3.5 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, New South Wales, Victoria.
Southern. Western Slopes, Western Plains.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): Gk. *hemi-*, half; *pogon*, beard. Lemma hairy only towards the apex.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, robust, 40–60 cm long. Leaf-sheaths smooth or scaberulous. Ligule a ciliate membrane. Leaf-blades erect, convolute, 2–3 mm wide. Leaf-blade surface glabrous or hispid.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, oblong, 15–30 cm long. Primary panicle branches appressed, 5–10 cm long. Spikelets solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–17 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 12–17 mm long, membranous, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6.5–8.5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 45–67 mm long overall, with twisted column. Column of lemma awn 10–12 mm long, plumose, hairy generally or on lower part. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, Victoria. South-West. Southern.

Austrostipa jacobsiana A.R.Williams. *Telopea* 13 (1–2) 186 (2011).

TYPE from Australia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Western Australia, Southern River, Perth, 14 Nov.2003, A.R.Williams 881 (holo: Perth 07770111; iso: NSW).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Named for Surrey Jacobs (1946–2009), Australian botanist based at NSW.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms 80–120 cm long. Leaf-sheaths puberulous. Leaf-sheath auricles erect. Ligule an eciliate membrane, 0.4–1 mm long, obtuse. Leaf-blades erect, filiform, conduplicate, 35–45 cm long, 0.5–0.8 mm wide, stiff. Leaf-blade surface ribbed, grooved adaxially, puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–20 cm long, 1–2 cm wide. Primary panicle branches 4–8 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–13 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1.6–2.1 mm long, pubescent, acute. Floret callus hairs 0.6–0.7 mm long (white).

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 9–12 mm long, membranous, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white, 0.4–0.5 mm long. Lemma apex dentate, 2 -fid, with lobes 0.4–0.8 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 38–49 mm long overall, with twisted column. Middle segment of lemma awn 4–9 mm long. Column of lemma awn 11–17 mm long, puberulous, with 0.1–0.15 mm long hairs. Palea 1 length of lemma, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 3, ovate, 1.1–1.5 mm long. Anthers 3, 3.2–3.3 mm long, anther tip smooth. Caryopsis with adherent pericarp, fusiform, 4.5–5 mm long. Embryo 0.25 length of caryopsis. Hilum linear, 0.66 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Derivation (Clifford & Bostock 2007): *L. juncea*, rush-like; *folium*, leaf. With rush-like leaf-blades or culms.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms erect, reed-like, 60–100 cm long, 2–3 -noded. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 5–7 mm long. Leaf-blades erect, acuminate, convolute, 30–60 cm long, 1–2 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 16–20 cm long. Primary panicle branches 2–6 cm long, bearing 6–10 fertile spikelets on each lower branch. Panicle branches smooth. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–6 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 9 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9 mm long, 1 length of upper glume, membranous, light brown, without keels, 3–5 -veined. Lower glume apex acute. Upper glume lanceolate, 9 mm long, membranous, light brown, without keels, 3–5 -veined. Upper glume apex acute.

Florets. Fertile lemma lanceolate, subterete, 7 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs white, 1–2 mm long. Lemma apex dentate, 2 -fid, with lobes 1.2–2 mm long, awned, 1 -awned. Principal lemma awn geniculate, 50 mm long overall, with twisted column. Column of lemma awn 10 mm long. Palea 1 length of lemma, without keels. Palea surface pilose.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Western Australia: 7 mi [11 km] N of Mundrabilla Homestead, foud growing on gently undulating calcareous plain up to height of 45 cm in a herbfield, 31 Jul 1974, *Mitchell 2* (HT: PERTH).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (84, Fig. 45), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (55, Fig. 8), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. lana*, wool; *-ata*, possessing. Ribs of lowermost leaf-sheaths woolly.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pilose or woolly. Culms 45 cm long, 1–2 mm diam., 1–2 -noded. Culm-internodes distally pubescent. Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths inflated, longer than adjacent culm internode, glabrous on surface to pubescent, outer margin hairy. Leaf-sheath oral hairs woolly. Ligule a ciliolate membrane, 0.4–1.5 mm long. Leaf-blades flat or involute, 20 cm long, 1.5–4 mm wide. Leaf-blade surface pubescent or woolly, densely hairy.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear, 10–15 cm long, bearing few spikelets. Primary panicle branches 1–4 cm long. Panicle axis pubescent. Panicle branches pubescent or pilose. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 4–15 mm long, pubescent or ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 19–26 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3 mm long, pilose, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 19–26 mm long, 1.4 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface smooth. Lower glume apex acuminate. Upper glume lanceolate, 14–19 mm long, membranous, without keels, 5 -veined. Upper glume surface smooth. Upper glume apex acuminate.

Florets. Fertile lemma oblanceolate, subterete, 6.5–8 mm long, coriaceous, dark brown, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma margins convolute, exposing palea. Lemma apex scabrous, surmounted by a ring of hairs, with this appendage 1.5 mm long, awned, 1 -awned. Principal lemma awn bigeniculate, 65–80 mm long overall, with twisted column. Middle segment of lemma awn 12–15 mm long. Column of lemma awn 10–15 mm long, pubescent, with 0.3 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 2 or 3, 0.5–1 mm long. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 4 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.85 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia. South-West. Southern.

Austrostipa macalpinei (Reader) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa macalpinei* Reader, *Victoria Naturalist* 15: 143 (1899). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Hilly Mallee country and sandy heaths, Lowan, Dimboola Shire, 1892, *F.M. Reader s.n.*

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (87, Fig. 48), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (386, Fig. 76 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Daniel McAlpine (1849–1932) Scots-born Australian mycologist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Annual, caespitose. Butt sheaths pubescent. Culms erect, robust, 20–40 cm long, 1-noded. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths striately veined, glabrous on surface or pubescent. Ligule an eciliate membrane, 8–10 mm long. Leaf-blades filiform, convolute, 1–2 mm wide. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, 10–20 cm long. Primary panicle branches 4–8 cm long. Panicle axis scabrous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 22 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 22 mm long, 1.6 length of upper glume, membranous, without keels, 3-veined. Lower glume apex acuminate. Upper glume lanceolate, 14 mm long, membranous, without keels, 5-veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex awned, 1-awned. Principal lemma awn geniculate, 120–150 mm long overall, with twisted column. Column of lemma awn 45 mm long, glabrous. Palea 1 length of lemma, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, Victoria. South-West. Southern.

Austrostipa metatoris (J. Everett & S.W.L. Jacobs) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

TYPE from Australia. **Basionym or Replaced Name:** *Stipa metatoris* J. Everett & S.W.L. Jacobs, *Telopea* 2(4): 399 (1983). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: J. Everett & S. Jacobs 341, 16 Oct 1981, Australia: New South Wales (US-3267702).

Illustrations (Books): S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (154), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (18, Fig. 2), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. metator*, surveyor. Named in allusion to D.W.L. Henderson (-), surveyor in New South Wales, Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms erect or geniculately ascending, 1.5–2.5 mm diam., 2–3-noded. Culm-internodes terete, distally glabrous or pubescent. Culm-nodes swollen, pubescent. Leaves basal and cauline. Leaf-sheaths tight, pubescent or hirsute, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1–2.2 mm long, pilose on abaxial surface, lacerate, truncate or obtuse or acute. Leaf-blades involute, 20–40 cm long, 2–4 mm wide. Leaf-blade surface ribbed, grooved adaxially, pubescent or hirsute, hairy on both sides.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, elliptic, 15–25 cm long, 3–6 cm wide. Primary panicle branches spreading, 5–10 cm long. Panicle axis scaberulous, glabrous or puberulous. Panicle branches scaberulous, glabrous or puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 5–10 mm long, scaberulous, glabrous or puberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 16–20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–2.8 mm long, pilose, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 16–20 mm long, 1.3 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume surface smooth or asperulous, rough on veins. Lower glume apex acuminate. Upper glume lanceolate, 10–15 mm long, membranous, much thinner above, without keels, 5 -veined. Upper glume surface smooth or asperulous, rough on veins. Upper glume apex acuminate.

Florets. Fertile lemma oblong or oblanceolate, subterete, 7–8.2 mm long, coriaceous, without keel, more than 3-veined. Lemma surface hirsute. Lemma margins convolute, covering most of palea. Lemma apex dentate, 2 -fid, with lobes 0.2–0.5 mm long, surmounted by a ring of hairs, with this appendage 2.5–3.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 55–65 mm long overall, with twisted column, limb glabrous or puberulous, with 0.2–0.3 mm long hairs. Middle segment of lemma awn 9–12 mm long. Column of lemma awn 11–13 mm long, puberulous, with 0.2–0.3 mm long hairs. Palea 0.9 length of lemma, without keels. Palea surface puberulous, hairy on back. Palea apex ciliate.

Flower and Fruit. Lodicules 3, 1.5–2 mm long. Anthers 3, 1.2–4 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3.5–4.5 mm long. Embryo 0.3–0.4 length of caryopsis. Hilum linear, 0.75 length of caryopsis.

Distribution (TDWG). Australasia.

Country /Province /State. Australia. South Australia, New South Wales. Southern. Western Plains.

Images: D.Sharp & B.K.Simon, *AusGrass*. *Grasses of Australia*. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): L. soft. Softly hairy usually of leaf-blades.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, short-lived, culms solitary or caespitose. Culms erect, 30–150 cm long, 1–3.5 mm diam., 3–6 -noded. Culm-internodes distally pubescent. Culm-nodes pubescent. Leaf-sheaths loose, pubescent, outer margin glabrous or hairy. Leaf-sheath oral hairs bearded. Ligule a ciliolate membrane, 1.2 mm long, pilose on abaxial surface. Leaf-blades involute, 15–45 cm long, 1.5–3 mm wide, coriaceous, stiff. Leaf-blade surface ribbed, pubescent, densely hairy, hairy adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 14–28 cm long, 5 cm wide. Primary panicle branches 3–7 cm long. Panicle axis scaberulous. Panicle branches bearded in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 3–5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 17.4–23 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.3–3.9 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 17.4–23 mm long, 1.1 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume surface puberulous. Lower glume apex acuminate. Upper glume lanceolate, 18–21 mm long, membranous, much thinner above, without keels, 5–7 -veined. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6.6–10.5 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface scaberulous, rough above, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs tawny. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 45–65 mm long overall, with twisted column, limb ciliate. Column of lemma awn 16.5–32

mm long, hirsute, with 1–2 mm long hairs. Palea 5–6 mm long, 0.9 length of lemma, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 2, 1.5 mm long. Anthers 3, 3.2–4.7 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, A.C.T., Victoria, Tasmania.

South-West. Southern. Coast, Tablelands, Western Slopes, Western Plains.

Austrostipa muelleri (Tate) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa muelleri* Tate, *Trans. & Proc. Roy. Soc. South Australia* 7: 70 (1885). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Australia: open parts in the stringy bark forests (Eucalyptus obliqua) at Uraidla, Mt. Lofty Range, and scrublands c. Mt. Jagged, towards Encounter Bay, flowering in October, *R. Tate s.n.* (HT: AD).

Dashorst & F.M.James, *Grasses of South Australia* (2006) (88, Fig. 49), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (379, Fig. 74 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (55, Fig. 8), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): in honor of Ferdinand Jacob Heinrich Mueller (1825–96) German-born Australian botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes short, knotty. Culms erect or decumbent, 50–100 cm long, 0.7–0.9(–1.2) mm diam., wiry. Lateral branches fastigiate or suffrutescent. Leaves cauline, with blades commonly suppressed, transferring photosynthetic function to sheath and culm. Leaf-sheaths wider than blade at the collar, ribbed (slightly to moderately). Leaf-sheath auricles erect. Ligule a fringe of hairs. Leaf-blades filiform, 0.1 cm long, 0.15 mm wide, stiff.

Inflorescence. Inflorescence comprising only a few spikelets, comprising 1–3 fertile spikelets. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, terete or flattened (slightly), 6–15 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets subterete, 18–30 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–3 mm long, pubescent or pilose.

Glumes. Glumes two, persistent, similar, thinner than fertile lemma. Lower glume lanceolate, 18–30 mm long, 1 length of upper glume, membranous or herbaceous, much thinner on margins, 3 -veined. Lower glume surface scabrous (upper 20 %). Lower glume apex acute. Upper glume lanceolate, 15–30 mm long, membranous or herbaceous, with scarious margins, without keels, 5 -veined. Upper glume surface scabrous (upper 20 %). Upper glume apex acute.

Florets. Fertile lemma linear to lanceolate, subterete, 13–20 mm long, herbaceous to coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent or pilose. Lemma hairs 0.3–0.6 mm long. Lemma apex lobed, 2 -fid, awned, 1 -awned. Principal lemma awn 50–100 mm long overall, with a straight or slightly twisted column, persistent or deciduous, limb puberulous (hairs 0.02–0.2 mm). Column of lemma awn 40–55 mm long. Palea elliptic (narrow), 0.75 length of lemma, coriaceous, 2 -veined, without keels. Palea surface pubescent or pilose, hairy on back (a band).

Flower and Fruit. Lodicules 3, oblanceolate, membranous. Anthers 3, 8–13 mm long.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, Victoria.
Southern.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. niteo*, shine; Spikelets or lemmas shiny.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations intravaginal. Culms erect, 75 cm long, 1–3 mm diam., compressible, 2–3 -noded. Culm-nodes swollen. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths longer than adjacent culm internode, glabrous on surface or puberulous, outer margin glabrous or hairy. Ligule an eciliate membrane or a ciliolate membrane, 0.3–1 mm long, truncate. Collar glabrous. Leaf-blades flat or involute, 20–40 cm long, 1–2 mm wide. Leaf-blade surface ribbed, scaberulous or scabrous. Leaf-blade margins glabrous or ciliate.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, 25–55 cm long, 0.5–7 cm wide. Primary panicle branches 5–6 cm long. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 2–10 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–13 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.2–2.2 mm long, pilose, acute. Floret callus hairs 1.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–13 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume primary vein smooth or scaberulous. Lower glume apex acute or acuminate. Upper glume lanceolate, 8–13 mm long, membranous, without keels, 5 -veined. Upper glume primary vein smooth or scaberulous. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex emarginate, awned, 1 -awned. Principal lemma awn bigeniculate, recurved at base of limb, 45–70 mm long overall, with twisted column. Middle segment of lemma awn 4 mm long. Column of lemma awn 6–9 mm

long, puberulous, with 0.1–0.3 mm long hairs. Palea 0.9 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back.

Flower and Fruit. Lodicules 2, 0.6–1.2 mm long. Anthers 3, 1–3.5 mm long, anther tip smooth or penicillate. Stigmas 2. Caryopsis with adherent pericarp, 2.5–3.5 mm long. Embryo 0.25–0.4 length of caryopsis. Hilum linear, 0.3–0.8 length of caryopsis.

Distribution (TDWG). Continent. Europe (*), Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Australia, New Zealand** (*). Western Australia, Northern Territory, South Australia, Queensland, New South Wales, Victoria.

Derivation (Clifford & Bostock 2007): *L. nix*, snow; *-cola*, dweller. Alpine species.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect or geniculately ascending, 25–50 cm long, 1 mm diam., firm, 2–3 -noded. Culm-internodes terete, distally pubescent. Culm-nodes flush with internodes, glabrous or pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths tight, ribbed, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 0.4–1.5 mm long, truncate. Leaf-blades convolute, 10–20 cm long, 1.5–3.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially. Leaf-blade margins smooth or scaberulous.

Inflorescence. Inflorescence a panicle, comprising 8–12 fertile spikelets. Panicle contracted, linear, 5–20 cm long, 1–2.5 cm wide, bearing few spikelets. Primary panicle branches 3–4 cm long. Panicle axis scaberulous. Panicle branches angular, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 10–30 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 20–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 3.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 20–25 mm long, 1 length of upper glume, membranous, purple, without keels, 4 -veined. Lower glume lateral veins ribbed. Lower glume surface pubescent. Lower glume apex acute or acuminate. Upper glume lanceolate, 15–20 mm long, membranous, purple, without keels, 5 -veined. Upper glume lateral veins ribbed. Upper glume apex acute.

Florets. Fertile lemma linear, subterete, 12–15 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface scabrous, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 0.5–1 mm long. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 85–130 mm long overall, with twisted column. Middle segment of lemma awn 10 mm long. Column of lemma awn 45–60 mm long. Palea 1 length of lemma, 2 -veined, without keels. Palea surface glabrous.

Flower and Fruit. Lodicules 2, 1–1.7 mm long. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 6–7.5 mm long. Embryo 0.2 length of caryopsis. Hilum linear, 1 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. **Australia.** New South Wales, A.C.T., Victoria. Tablelands.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. nodus*, knot; -osa, abundance. Culms with more nodes than those of related species.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal. Culms erect, 50–100 cm long, 1–2 mm diam., 3–5 -noded. Culm-internodes smooth or scaberulous. Culm-nodes swollen, glabrous. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths mostly shorter than adjacent culm internode, smooth or scaberulous, outer margin glabrous or hairy. Ligule an eciliate membrane, 0.5–2 mm long, truncate. Collar glabrous. Leaf-blades flat or involute, 15–30 cm long, 1–3 mm wide. Leaf-blade surface ribbed, scaberulous, rough on both sides. Leaf-blade margins glabrous or ciliate.

Inflorescence. Inflorescence a panicle. Panicle open, 15–50 cm long, 1–2 cm wide. Primary panicle branches 1–8 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 2–15 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–2.5 mm long, pilose, acute. Floret callus hairs 0.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–15 mm long, 0.75–1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume surface smooth or asperulous. Lower glume apex acute or acuminate. Upper glume lanceolate, 7–19 mm long, hyaline, without keels, 5 -veined. Upper glume surface smooth or asperulous. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 4–7 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 0.3–0.6 mm long. Lemma apex entire or dentate, 2 -fid, with lobes 0–0.4 mm long, awned, 1 -awned. Principal lemma awn apical or from a sinus, bigenulate, recurved at base of limb, 45–100 mm long overall, with twisted column. Middle segment of lemma awn 2–5 mm long. Column of lemma awn 5–10 mm long. Palea 1 length of lemma, 2 -veined, without keels. Palea surface puberulous, hairy on back.

Flower and Fruit. Lodicules 3, 1–2 mm long. Anthers 3, 2–3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 3–4 mm long. Embryo 0.2–0.3 length of caryopsis. Hilum linear, 0.5–0.8 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand (*). South Australia, Queensland, New South Wales, Victoria, Tasmania. New Zealand North I, New Zealand South I.

NW & Lake Eyre, Southern. South East. Coast, Tablelands, Western Slopes, Western Plains.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): named for "Nulla Nulla" a property in New South Wales, Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Culms erect, 40–50 cm long, 1–2 mm diam., 2 -noded. Culm-internodes distally glabrous or pubescent. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths loose, longer than adjacent culm internode, glabrous on surface, outer margin hairy. Ligule an eciliate membrane, 1–5 mm long, lacerate. Leaf-blades flat or involute, 15–20 cm long, 2–3 mm wide, stiff. Leaf-blade surface ribbed, scaberulous, rough abaxially, pubescent, hairy adaxially. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, 13–19 cm long. Primary panicle branches spreading, 4–6 cm long. Panicle axis scabrous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 3–15 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–11 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–2.7 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–11 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 8–10 mm long, membranous, without keels, 5 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 5–6 mm long, coriaceous, dark brown, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex scabrous, with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 1–1.5 mm long (as to hairs), awned, 1 -awned. Principal lemma awn bigeniculate, 50–70 mm long overall, with twisted column. Middle segment of lemma awn 10–15 mm long. Column of lemma awn 50–60 mm long, puberulous, with 0.2 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels. Palea surface glabrous or pubescent, hairy above.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 2.7–3 mm long. Embryo 0.25–0.33 length of caryopsis. Hilum linear, 0.66–0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, New South Wales, Victoria.

NW & Lake Eyre, Southern. Western Plains.

Austrostipa nullarborensis (Vickery, S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa nullarborensis* Vickery, S.W.L. Jacobs & J. Everett, *Telopea* 3(1): 88 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Western Australia: Abrakurrie Cave, 18 mi [29 km] NW of Eucla, open depression near entrance to cave, 23 Sep 1965, A.C. Beauglehole 13395 (NSW; IT: CANB, PERTH).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (31, Fig. 4), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Nullarbor Plain, Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Rhizomes short. Culms 50–100 cm long, 1(–3) mm diam., 4–5 -noded. Culm-internodes smooth to antrorsely scabrous. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth to antrorsely scabrous, glabrous on surface to pubescent. Leaf-sheath oral hairs lacking. Ligule an eciliate membrane, 2–3 mm long, truncate. Leaf-blades 10–25 cm long, 2–5 mm wide. Leaf-blade surface scaberulous, rough on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15–30 cm long, 1.5–3 cm wide. Primary panicle branches 2–8 cm long. Panicle axis smooth or scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–7 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 4–5.5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 0.5–0.8 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 4–5.5 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface hispidulous. Lower glume apex obtuse or acute. Upper glume lanceolate, 4–5.5 mm long, membranous, without keels, 5 -veined. Upper glume surface hispidulous. Upper glume apex obtuse or acute.

Florets. Fertile lemma linear, subterete, 3–4 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface granulose, pilose. Lemma margins convolute, covering most of palea. Lemma apex entire or dentate, 2 -fid, with lobes 0.1 mm long, awned, 1 -awned. Principal lemma awn apical or from a sinus, bigeniculate, 20–30 mm long overall, with twisted column. Middle segment of lemma awn 4–5 mm long. Column of lemma awn 5–8 mm long. Palea 0.8 length of lemma, 2 -veined, without keels. Palea surface pilose.

Flower and Fruit. Lodicules 2 or 3. Anthers 3, 1.5–1.7 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia. South-West.

Austrostipa oligostachya (Hughes) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa oligostachya* Hughes, *Bull. Misc. Inform. Kew* 1921: 12 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Robertson 534*, Australia: Victoria: Wando Vale [as Wndu Vale], growing in tussocks (K).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (89, Fig. 50), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (398, Fig. 79 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (55, Fig. 8), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): Gk. *oligos*, few; *stachys*, ear of corn. Inflorescence with few branches.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths villous. Culms 30–65 cm long, 2 -noded. Culm-nodes pubescent. Leaf-sheaths glabrous on surface or pubescent. Ligule a ciliate membrane. Leaf-blades curved, filiform, convolute, 12–20 cm long, 1–2 mm wide, coriaceous, stiff. Leaf-blade venation with continuous uniform subepidermal sclerenchyma layer on the underside. Leaf-blade surface smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, 15–20 cm long, bearing few spikelets. Primary panicle branches 3–7 cm long, bearing 2–5 fertile spikelets on each lower branch. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 6–10 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 14 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 14 mm long, 1.2 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acute or acuminate. Upper glume lanceolate, 12 mm long, membranous, without keels, 5 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma lanceolate, subterete, 9 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, rough above, pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma hairs yellow. Lemma apex dentate, 2 -fid, with lobes 1–2 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 50 mm long overall, with twisted column. Column of lemma awn 20 mm long, glabrous. Palea 1 length of lemma, without keels. Palea surface pilose.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, Victoria. Southern.

Austrostipa petraea (Vickery) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa petraea* Vickery, *Telopea* 2: 15 (1980). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Australia: Flinders Ranges, Brachina Gorge, Orparinna National Park, western portion, 18 Sep 1971, J.Z. Weber 2577 (HT: AD).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (90, Fig. 52), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. that grows amongst rocks. Growing in rocky places.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 50–100 cm long, 1.5–2 mm diam., 3–5 -noded. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths glabrous on surface, outer margin glabrous. Ligule a ciliate membrane, 0.1–1 mm long. Collar glabrous. Leaf-blades conduplicate or involute, 25–50 cm long, 1.5 mm wide. Leaf-blade surface ribbed, scaberulous, rough adaxially, glabrous, hairless except near base.

Inflorescence. Inflorescence a panicle. Panicle open, 25 cm long. Primary panicle branches 3–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 10–35 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 11–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pilose (tawny hairs), acute. Floret callus hairs 0.3–0.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 11–15 mm long, 1 length of upper glume, membranous, without keels, 6 -veined. Lower glume surface asperulous. Lower glume apex acute or acuminate. Upper glume lanceolate, 11–13 mm long, membranous, without keels, 5 -veined. Upper glume surface asperulous. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 7–9.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface smooth or granulose, pilose. Lemma margins convolute, covering most of palea. Lemma hairs tawny, 0.5–1.5 mm long. Lemma apex lobed, 2 -fid, with lobes 1.5–2.5 mm long, surmounted by a ring of hairs, with this appendage 2.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 40–55 mm long overall, with twisted column. Middle segment of lemma awn 10 mm long. Column of lemma awn 10–15 mm long. Palea 1 length of lemma, 2 -veined, without keels. Palea surface pilose.

Flower and Fruit. Lodicules 3, 1–1.3 mm long. Anthers 3, 4.5–5 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia. Southern.

Austrostipa pilata (S.W.L. Jacobs & J. Everett) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa pilata* S.W.L. Jacobs & J. Everett, *Telopea* 3(1): 92 (1986). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: South Australia: Murray: Monarto City Centre site, lake site area, growing under mallee, 26 Nov 1974, D.E. Simon 9072 (HT: NSW; IT: ADW).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (75, Fig. 36), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (386, Fig. 76 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (44, Fig. 6), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. pilus*, a hair; *-ata*, possessing. With long hairs on the leaf-blades or spikelets.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths pubescent. Basal innovations extravaginal. Culms erect, 40–85 cm long, 0.8–1 mm diam., firm, 2–3 -noded. Culm-internodes distally pubescent. Culm-nodes swollen, glabrous or pubescent. Lateral branches lacking. Leaf-sheaths tight, mostly shorter than adjacent culm internode, glabrous on surface or pubescent, outer margin hairy. Leaf-sheath oral hairs ciliate, 1–2 mm long. Ligule a ciliolate membrane, 1–2 mm long, pubescent on abaxial surface, entire or lacerate, truncate. Leaf-blades involute, 6–12 cm long, 2–6 mm wide. Leaf-blade surface ribbed, scabrous, rough abaxially, pubescent, hairy adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–20 cm long, 2–3 cm wide. Panicle axis smooth or scaberulous. Panicle branches smooth or scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flattened, 4–8 mm long, smooth or scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–1.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 7–9 mm long, membranous, without keels, 3 -veined. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 4–5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface papillose, pubescent. Lemma margins convolute, covering most of palea. Lemma apex surmounted by a ring of hairs (in 1–2 tufts), awned, 1 -awned. Principal lemma awn geniculate, recurved at base of limb, 40–50 mm long overall, with twisted column. Column of lemma awn 7–11 mm long, pubescent, with 0.2–0.5 mm long hairs. Palea 0.75 length of lemma, 2 -veined, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 2, 1–1.5 mm long. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 2.7–3 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.66 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, Victoria. Southern.

Austrostipa platychaeta (Hughes) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 587. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa platychaeta* Hughes, *Bull. Misc. Inform. Kew* 1921: 16, f. 17 & 17A (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Koch 1133 pro parte*, Australia: Western Australia: Lake Cowcowing (K).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (71, Fig. 32), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (382, Fig. 75), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (31, Fig. 4), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler,,

Grasses of New South Wales, 4th edn (2008) (155), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *G. platys*, broad; *chaete*, bristle. Awns flattened.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, culms solitary. Cataphylls evident. Rhizomes short, woody. Culms erect or geniculately ascending, 60–90 cm long, woody, 5–10 -noded. Culm-internodes glaucous, distally glabrous. Lateral branches lacking or sparse. Leaf-sheaths smooth, glabrous on surface. Ligule an eciliate membrane, 5 mm long, truncate. Leaf-blades 7–15 cm long, 2–5 mm wide. Leaf-blade surface glabrous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, lanceolate, 10–20 cm long. Primary panicle branches appressed or ascending, 4–5 cm long, bearing 3–4 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, flexuous, 3–10 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.6 mm long, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 12–15 mm long, 1.2–1.3 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 9–12 mm long, membranous, with hyaline margins, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, recurved at base of limb, flat below (as to limb), 60–80 mm long overall, with twisted column. Column of lemma awn 10 mm long, puberulous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, Victoria. South-West. NW & Lake Eyre, Southern. Western Slopes, Western Plains.

Austrostipa plumigera (Hughes) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 588. 1996.

Derivation (Clifford & Bostock 2007): *L. pluma*, feather; *gero*, bear. With a villous awn.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–55 cm long, 2–3 -noded. Culm-nodes pubescent. Leaf-sheaths puberulous. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane. Leaf-blades 15–35 cm long, 2–3 mm wide. Leaf-blade surface pubescent, densely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle contracted, 10–20 cm long. Panicle axis scaberulous. Panicle branches scaberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1–5 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 20 mm long, 1.3 length of upper glume, membranous, much thinner above,

without keels, 3 -veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 15 mm long, membranous, much thinner above, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pilose. Lemma margins convolute, covering most of palea. Lemma hairs tawny. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 90 mm long overall, with twisted column, limb hirsute, with 1–1.5 mm long hairs. Column of lemma awn hirsute, with 1–1.5 mm long hairs. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. pubes*, signs of puberty; *-ula*, diminutive. Plant covered in whole or in part with short hairs.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–50 cm long. Ligule a ciliate membrane. Leaf-blades filiform, involute, 1–2 mm wide. Leaf-blade surface glabrous or puberulous.

Inflorescence. Inflorescence a panicle. Panicle open, dense, 15–20 cm long. Primary panicle branches ascending. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, recurved at apex. Lower glume ovate, 1 length of upper glume, chartaceous, without keels, 3 -veined. Lower glume apex obtuse or acute. Upper glume ovate, 10 mm long, membranous, firmer above, without keels, 5 -veined. Upper glume apex obtuse or acute.

Florets. Fertile lemma lanceolate, subterete, 6 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 30 mm long overall, with twisted column. Column of lemma awn 8 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, Victoria. South-West. Southern. Western Plains.

Austrostipa pubescens (R. Br.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 588. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa pubescens* R.Br., *Prodr.* 174 (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *R. Brown 6203 (sheet II)*,

1802–1805, Australia: New South Wales: Port Jackson (BM; IT: K). LT designated by Vickery, Jacobs & Everett, *Telopea* 3: 97 (1986).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (48, Fig. 7 & 55, Fig. 8), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (157), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);.

Derivation (Clifford & Bostock 2007): *L. pubesco*, become hairy. Plant whole or in part hairy.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Basal innovations extravaginal. Culms erect, 80–150 cm long, 1–4 mm diam., firm, 2–3 -noded. Culm-internodes terete, distally pubescent. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths tight, glabrous on surface or pubescent, outer margin hairy. Leaf-sheath oral hairs pubescent. Ligule an eciliate membrane or a ciliolate membrane, 0.4–1 mm long, scarious, truncate. Leaf-blades flat or convolute, 25–50 cm long, 2–4 mm wide. Leaf-blade surface ribbed, pubescent, hairy adaxially or on both sides.

Inflorescence. Inflorescence a panicle. Panicle open, 15–30 cm long, 2–4 cm wide. Primary panicle branches branching laterally, 3–7 cm long. Panicle axis scabrous. Panicle branches angular, scabrous, glabrous or pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 10–30 mm long, scabrous, glabrous to pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 17–24 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 3–4.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 17–24 mm long, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume lateral veins ribbed. Lower glume surface pubescent, hairy generally or on veins. Lower glume margins ciliate. Lower glume apex truncate. Upper glume linear, 15–20 mm long, membranous, purple, without keels, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface pubescent, hairy generally or on veins. Upper glume margins ciliate. Upper glume apex truncate.

Florets. Fertile lemma linear, subterete, 11–15 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface tuberculate, rough above, pilose. Lemma margins convolute, covering most of palea. Lemma hairs tawny. Lemma apex with a short cylindrical neck, awned, 1 -awned. Principal lemma awn bigeniculate, 70–100 mm long overall, with twisted column. Middle segment of lemma awn 10–15 mm long. Column of lemma awn 30–55 mm long, puberulous, with 0.05–0.15 mm long hairs. Palea 0.5–0.9 length of lemma, 2 -veined, without keels. Palea surface glabrous.

Flower and Fruit. Lodicules 2 or 3, 1–2 mm long. Anthers 3, 2–6 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp, 5–8 mm long. Embryo 0.15–0.2 length of caryopsis. Hilum linear, 0.9 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland, New South Wales.

Central, South East, Inland. Coast, Tablelands.

Derivation (Clifford & Bostock 2007): *L. pubes*, signs of puberty; nodus, knot. Nodes hairy.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, short-lived, culms solitary or caespitose. Culms 60–110 cm long, 3–5 -noded. Leaf-sheaths puberulous, outer margin glabrous or hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 1.5–2 mm long, obtuse. Leaf-blades filiform, convolute, 15–50 cm long, 1–2.5 mm wide, stiff, dark green. Leaf-blade surface ribbed, smooth, pubescent, densely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Peduncle pubescent above. Panicle open, 15–26 cm long. Primary panicle branches 6–10 -nate, 3–6 cm long, bearing 3–4 fertile spikelets on each lower branch. Panicle branches pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 3–20 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 20–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3.5–4.6 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 20–25 mm long, 1.2 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume surface puberulous. Lower glume apex acuminate. Upper glume lanceolate, 16–21 mm long, membranous, much thinner above, without keels, 5 -veined. Upper glume surface puberulous. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 11–13 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface scabrous, rough above, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs tawny. Lemma apex awned, 1 -awned. Principal lemma awn bigenulate, 65–90 mm long overall, with twisted column. Column of lemma awn 35–54 mm long, puberulous. Palea 7.2–8 mm long, 1 length of lemma, coriaceous, without keels. Palea surface glabrous.

Flower and Fruit. Lodicules 3, 3 mm long. Anthers 3, 5.3–6.6 mm long, yellow. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, New South Wales, Victoria, Tasmania. Southern. Coast.

Derivation (Clifford & Bostock 2007): Gk. *pyknos*, thick; *stachys*, ear of corn. Inflorescence a contracted panicle.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 15–30 cm long, wiry. Ligule an eciliate membrane. Leaf-blades aciculate, terete, 1–2 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Inflorescence a panicle. Panicle spiciform, linear, 5–10 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Sterile Spikelets. Basal sterile spikelets absent or rudimentary.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 10–12 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 10–12 mm long, membranous, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 3 mm long, coriaceous, without keel, more than 3-veined. Lemma surface villous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned.

Principal lemma awn geniculate, 30–40 mm long overall, with twisted column. Palea 1 length of lemma, without keels. Palea apex ciliate.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia.
South-West.

Derivation (Clifford & Bostock 2007): *L. ramus*, branch; *-osa*, abundance; *-issima*, most. Culms much branched.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Culms erect, 100–250 cm long, 0.5–7 mm diam., 6–9 -noded. Culm-internodes distally glabrous. Culm-nodes swollen. Lateral branches fastigiate. Leaves cauline. Leaf-sheaths glabrous on surface, outer margin glabrous. Ligule an eciliate membrane, 0.25–0.5 mm long, erose. Leaf-blades deciduous at the ligule, 35–40 cm long, 1–10 mm wide. Leaf-blade surface ribbed, scabrous, rough on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 8–20 cm long, 2–4 cm wide. Primary panicle branches spreading, 3.5–5.5 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–10 mm long.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 2.3–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 0.2 mm long, pilose, acute. Floret callus hairs 0.25–0.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 2.3–3 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface scabrous. Lower glume apex erose, acute. Upper glume lanceolate, 2.4–2.8 mm long, membranous, without keels, 3 -veined. Upper glume surface smooth. Upper glume apex erose, acute.

Florets. Fertile lemma linear, subterete, 1.8–2.5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface tuberculate, glabrous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 17–30 mm long overall, with twisted column. Column of lemma awn 5–7 mm long. Palea 0.33 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 2. Anthers 3, 1–1.3 mm long, anther tip penicillate. Stigmas 2. Caryopsis with adherent pericarp, 1.5–1.6 mm long. Embryo 0.25 length of caryopsis. Hilum linear, 0.33 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Queensland, New South Wales, Lord Howe-Norfolk Is.
North, Central, South East, Inland. Coast, Tablelands, Western Slopes, Western Plains.

Austrostipa rudis (Spreng.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 588. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa rudis* Spreng., 4: Cur. Post. 31 (1827). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Sieber 66*, Australia (?; IT: K, MEL59980, MEL-59982).

Illustrations (Books): N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (398, Fig. 79 as *Stipa rudis* subsp. *australis*, subsp. *rudis* & subsp. *neutralis*), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (158), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (55, Fig. 8), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. uncultivated. Species whose relatives are often cultivated.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Basal innovations extravaginal. Culms geniculately ascending, 60–120 cm long, 2–4 mm diam., firm, 2–4 -noded. Culm-internodes terete, smooth or scaberulous, distally pubescent. Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths inflated, ribbed, glabrous on surface or puberulous, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.5–2 mm long, scarious, pubescent on abaxial surface, truncate or acute. Collar pilose. Leaf-blades involute, 20–40 cm long, 2–5 mm wide. Leaf-blade surface ribbed, scaberulous, rough abaxially, pubescent, densely hairy, hairy adaxially.

Inflorescence. Inflorescence a panicle. Panicle open or contracted, linear, 25–50 cm long, 1.5–5 cm wide. Primary panicle branches 7–15 cm long. Panicle axis smooth or scabrous. Panicle branches terete, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 5–15 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 8–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, curved, 0.8–3.2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear or oblong, 8–15 mm long, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume lateral veins ribbed. Lower glume surface asperulous, rough on veins, glabrous to pubescent. Lower glume apex erose, truncate or obtuse. Upper glume linear or oblong, 7–14.5 mm long, membranous, without keels, 3–5 -veined. Upper glume lateral veins ribbed. Upper glume surface asperulous, rough on veins, glabrous or pubescent. Upper glume apex erose, truncate or obtuse.

Florets. Fertile lemma linear or lanceolate, subterete, 5–11.5 mm long, coriaceous, dark brown, without keel, 5 -veined, more than 3-veined. Lemma surface tuberculate, rough above, pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 20–90 mm long overall, with twisted column. Middle segment of lemma awn 4–15 mm long. Column of lemma awn 4.5–30 mm long, glabrous or puberulous, with 0.05–0.3 mm long hairs. Palea 0.9 length of lemma, 2 -veined, without keels. Palea surface glabrous.

Flower and Fruit. Lodicules 2 or 3, 1–1.7 mm long. Anthers 3, 2–4 mm long. Stigmas 2. Caryopsis with adherent pericarp, 3–6 mm long. Embryo 0.2–0.25 length of caryopsis. Hilum linear, 0.7–0.8 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. rough or gritty to the touch. Plants with rough leaf-blades, spikelets or stems.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Culms 30–60 cm long, compressible. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 2–5 mm long, bilobed. Leaf-blades convolute, 1–2 mm wide. Leaf-blade surface scabrous, glabrous or puberulous, hairy abaxially.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle contracted, linear, 15–30 cm long. Primary panicle branches appressed, 3–5 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8–10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1–1.5 mm long, bearded, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8–10 mm long, 1 length of upper glume, hyaline, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 8–10 mm long, hyaline, without keels, 3–5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 4–5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface scabrous, puberulous. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 40–60 mm long overall, with twisted column. Column of lemma awn 10–12 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Europe (*), Australasia, Pacific.

Austrostipa semibarbata (R. Br.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 588. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa semibarbata* R.Br., *Prodr.* 174 (1810). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *R. Brown 6204*, Australia: Tasmania: Port Dalrymple (BM).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (104, Fig. 66), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (398, Fig. 79 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (18, Fig. 2), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (159), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. *semi-*, half; *barba*, beard; *-ata*, possessing. Awn column hairy but bristle asperous.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long, 3–5 -noded. Culm-nodes pubescent. Leaf-sheaths hispid, outer margin hairy. Leaf-sheath oral hairs bearded. Ligule a ciliate membrane, 1–2 mm long. Leaf-blades erect, convolute, 15–35 cm long, 2–4 mm wide. Leaf-blade surface ribbed, glabrous or pubescent. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, oblong, 15–22 cm long. Primary panicle branches appressed, 2–3 -nate, 3–7 cm long. Panicle axis puberulous. Panicle branches puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 17–24 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3.2–4.5 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume apex acuminate. Upper glume linear, 17–24 mm long, membranous, purple, without keels, 5 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7–8 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn bigeniculate, 75–85 mm long overall, with twisted column. Column of lemma awn 35 mm long, plumose, hairy generally, with 0.3–1.6 mm long hairs. Palea 1 length of lemma, without keels.

Flower and Fruit. Lodicules 3, 3 mm long. Anthers 3, 2.6–6 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, Victoria, Tasmania.

South-West. Southern. Coast, Tablelands.

Austrostipa setacea (R. Br.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 589. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa setacea* R.Br., *Prodr.* 174 (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Brown s.n.*, 1802–1805, Australia: New South Wales: Port Jackson (BM). LT designated by Vickery, Jacobs & Everett, *Telopea* 3: 113 (1986).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (80, Fig. 41), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (392, Fig. 78 as *Stipa*), T.D.Stanley & E.Ross, *Flora of South East Queensland, Gramineae* (1989) (as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig 5), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (159), D.Sharp & B.K.Simon, *AusGrass*. *Grasses of Australia*. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. seta*, bristle; *-acea*, indicating resemblance. With bristle-like leaf-blades.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 40–80 cm long, 1 mm diam., 2–4 -noded. Culm-internodes ridged, distally glabrous or pubescent. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths tight, ribbed, smooth or scaberulous, outer margin glabrous. Ligule an eciliate membrane, 2–9 mm long, obtuse. Leaf-blades conduplicate or involute, 15–30 cm long, 0.5–1.5 mm wide. Leaf-blade surface ribbed, puberulous, hairy adaxially. Leaf-blade margins smooth or scaberulous.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 10–20 cm long, 1.5–3 cm wide. Primary panicle branches 1.5–4.5 cm long. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 1.5–7.5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–15 mm long, breaking up at maturity,

disarticulating below each fertile floret. Floret callus elongated, 1.7–2.5 mm long, pubescent, acute. Floret callus hairs 0.1–1 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 9–15 mm long, 1.3–1.5 length of upper glume, hyaline, without keels, 3 -veined. Lower glume surface smooth or asperulous, rough at apex. Lower glume apex acuminate. Upper glume lanceolate, 7–10 mm long, hyaline, without keels, 5 -veined. Upper glume surface smooth or asperulous, rough at apex. Upper glume apex acuminate.

Florets. Fertile lemma oblanceolate, subterete, 5.5–7 mm long, coriaceous, black, without keel, 5 -veined, more than 3-veined. Lemma surface scaberulous, with a median groove, pubescent. Lemma margins involute, interlocking with palea keels. Lemma hairs 0.4–0.8 mm long. Lemma apex with a short cylindrical neck, awned, 1 -awned. Principal lemma awn eccentric, bigeniculate, 25–40 mm long overall, with twisted column. Middle segment of lemma awn 5–7 mm long. Column of lemma awn 5–8 mm long, puberulous. Palea 1 length of lemma, 2 -veined. Palea keels contiguous above a sulcus.

Flower and Fruit. Lodicules 3, 0.4–1.5 mm long. Anthers 3, 2.1–2.3 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp, sulcate on hilar side, 2.5–3 mm long. Embryo 0.2–0.4 length of caryopsis. Hilum linear, 0.7–0.8 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. South Australia, Queensland, New South Wales, Victoria. Southern. South East, Inland. Coast, Tablelands, Western Slopes, Western Plains.

Austrostipa stipoides (Hook. f.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 589. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), E.Edgar, & H.Connor, *Flora of New Zealand Gramineae* 5 (2000).

TYPE from New Zealand. **Basionym or Replaced Name:** *Dichelachne stipoides* Hook. f., *Fl. Nov.-Zel.* 1: 294, t. 66 (1853). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Hooker s.n.*, New Zealand: Bay of Islands (K). LT designated by Townrow, *Pap. Proc. Roy. Soc. Tasmania* 112: 277–287 (1978).

Recent Synonyms: *Stipa stipoides* (Hook. f) Veldkamp, *Blumea*, 22(1):11 (1974).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (91, Fig. 53), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (379, Fig. 74 as *Stipa*), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (37, Fig. 5), S.W.L.Jacobs, R.D.B.Whalley & D.J.B.Wheeler., *Grasses of New South Wales*, 4th edn (2008) (159), D.Sharp & B.K.Simon, *AusGrass*. Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);, E.Edgar & H.E.Connor, *Flora of New Zealand* 5, *Gramineae* (2000);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. With spikelets resembling those of *Stipa*.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 30–90 cm long, wiry, 3–4 -noded. Culm-internodes smooth. Culm-nodes flush with internodes. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane, 7 mm long. Leaf-blades erect, acuminate, involute, 20–70 cm long, 1 mm wide, stiff. Leaf-blade surface ribbed, puberulous, hairy adaxially. Leaf-blade apex pungent.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 11–22 cm long, 2 cm wide, bearing few spikelets. Primary panicle branches 1–4 cm long, bearing 1–5 fertile spikelets on each lower branch. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 2–8 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15–21 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2–2.6 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume lateral veins obscure. Lower glume apex attenuate. Upper glume lanceolate, 15–21 mm long, membranous, without keels, 5 -veined. Upper glume apex attenuate.

Florets. Fertile lemma lanceolate, subterete, 8.5–12.5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea, ciliate, hairy above. Lemma apex dentate, 2-fid, with lobes 1.4–3.6 mm long, awned, 1-awned. Principal lemma awn from a sinus, bigeniculate, 20–30 mm long overall, with twisted column. Column of lemma awn 10–14 mm long, puberulous, hairy on the spiral. Palea 1 length of lemma, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 3, 2 mm long. Anthers 3, 7.2–8.2 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand. South Australia, New South Wales, Victoria, Tasmania. New Zealand North I, New Zealand South I. Southern. Coast.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): L. tow, that is fibre for rope-making. Leaf-bases breaking into fibres.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, short-lived, caespitose. Butt sheaths pubescent, persistent and investing base of culm, with fibrous dead sheaths. Culms erect or geniculately ascending, 80–140 cm long, 2–3.5 mm diam., 3–5-noded. Culm-nodes pubescent. Leaf-sheaths pubescent, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane, 0.3 mm long. Leaf-blades convolute, 19–30 cm long, 2–5 mm wide, stiff. Leaf-blade surface ribbed, pubescent, hairy adaxially. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 17–35 cm long, 7 cm wide. Primary panicle branches 5–10 cm long. Panicle axis puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–8 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 18–24 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 3 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 18–24 mm long, 1.2 length of upper glume, membranous, without keels, 3-veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 15–20 mm long, membranous, without keels, 5-veined. Upper glume surface scabrous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 7.6–11.5 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex surmounted by a ring of hairs, with this appendage 1.5–3 mm long, awned, 1-awned. Principal lemma awn bigeniculate, 50–65 mm long overall, with twisted column. Column of lemma awn 19–36 mm long, hirsute. Palea 1 length of lemma, without keels. Palea surface pubescent.

Flower and Fruit. Lodicules 3, 1–3 mm long. Anthers 4–6 mm long. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia, New Zealand (*). South Australia, New South Wales, Victoria, Tasmania. New Zealand South I. Southern. Coast, Western Plains.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa tenuifolia* Steud., *Syn. Pl. Glumac.* 1: 128 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Drummond IV 391*, Australia (P; IT: K, MEL-59997).

Illustrations (Books): J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (78, Fig. 39), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (44, Fig. 6), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. tenuis*, slender; *folium*, leaf. Leaf-blades narrow.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long. Ligule a ciliate membrane. Leaf-blades filiform, involute, 1–2 mm wide. Leaf-blade surface smooth or scaberulous, glabrous.

Inflorescence. Inflorescence a panicle. Panicle open, effuse, 15–30 cm long. Panicle branches capillary. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 15 mm long, 1.2–1.3 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface asperulous. Lower glume apex acuminate. Upper glume lanceolate, 12 mm long, membranous, without keels, 5 -veined. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 8 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 50–70 mm long overall, with twisted column. Column of lemma awn 13 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Australasia.

Country /Province /State. **Australia.** Western Australia, South Australia. South-West. Southern.

Austrostipa trichophylla (Benth.) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 589. 1996.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *Gk. thrix*, hair; *phyllon*, leaf. Leaf-blades hair-like.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 20–40 cm long. Culm-nodes glabrous or pubescent. Leaf-sheaths smooth or scaberulous, glabrous on surface or hispid. Ligule a ciliate membrane. Leaf-blades filiform, involute, 1–2 mm wide. Leaf-blade surface hispid.

Inflorescence. Inflorescence a panicle. Panicle open, oblong, 13–26 cm long. Panicle axis scabrous. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then

both fertile or the upper sterile. Spikelets lanceolate, subterete, 10 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2 mm long, bearded, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume linear, 1 length of upper glume, membranous, without keels, 3 -veined. Lower glume apex setaceously acuminate. Upper glume linear, 10 mm long, membranous, without keels, 5 -veined. Upper glume apex setaceously acuminate.

Florets. Fertile lemma lanceolate, subterete, 5–6 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 40–50 mm long overall, with twisted column. Column of lemma awn 12–13 mm long, glabrous. Palea 1 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, Northern Territory, South Australia, New South Wales, Victoria.

Ereman, South-West. Central Australia. NW & Lake Eyre, Southern. Western Plains.

Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): in honor of Gerard Tucker (1854–1930) Australian farmer.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial. Culms 20–30 cm long, wiry. Culm-nodes pubescent. Leaf-sheaths pubescent. Ligule a ciliolate membrane, 3 mm long. Leaf-blades flat or involute, 2–4.5 mm wide. Leaf-blade surface pubescent.

Inflorescence. Inflorescence a panicle, deciduous as a whole. Panicle open, 8–12 cm long. Primary panicle branches spreading, whorled at most nodes, 4–5 cm long. Panicle branches pubescent. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, pubescent.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 8 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus brief, pubescent, obtuse.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 8 mm long, 1 length of upper glume, membranous, purple, without keels, 3 -veined. Lower glume surface glabrous. Lower glume apex acuminate. Upper glume lanceolate, 8 mm long, membranous, purple, without keels, 3 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 5 mm long, coriaceous, without keel, more than 3-veined. Lemma surface pubescent, hairy below. Lemma margins convolute, covering most of palea. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, 30–35 mm long overall, with twisted column. Column of lemma awn glabrous. Palea 1 mm long, 0.2 length of lemma, without keels.

Flower and Fruit. Stigmas 2.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia, New South Wales, Victoria. South-West. Southern. Western Slopes, Western Plains.

Austrostipa variabilis (Hughes) S.W.L. Jacobs & J. Everett. *Telopea* 6(4): 589. 1996.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Stipa*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002).

TYPE from Australia. **Basionym or Replaced Name:** *Stipa variabilis* D.K.Hughes, *Kew Bull.* 1921, 15 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Drummond 961*, Australia:Western Australia (K (photo, CANB); IT: MEL-59987).

Illustrations (Books): A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (44, Fig. 6), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Derivation (Clifford & Bostock 2007): *L. varius*, variable; *-abilis*, indicating capacity. As for *varia*.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–80 cm long, 1–1.5 mm diam., 1–3 -noded. Culm-nodes glabrous or pubescent. Leaf-sheaths glabrous on surface, outer margin hairy. Leaf-sheath oral hairs scanty or lacking. Ligule a ciliolate membrane, 1–2 mm long. Leaf-blades flexuous, convolute, 9–25 cm long, 1–3 mm wide. Leaf-blade surface ribbed, glabrous or puberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, linear, 10–20 cm long, 2–3 cm wide. Primary panicle branches appressed, 2–4 -nate, 2–3 cm long. Panicle axis smooth. Panicle branches scaberulous, pubescent in axils. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–5 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 10–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, 1–2 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, shiny. Lower glume lanceolate, 1 length of upper glume, membranous, much thinner above, without keels, 3 -veined. Lower glume apex acuminate. Upper glume lanceolate, 10–15 mm long, membranous, with hyaline margins, without keels, 5 -veined. Upper glume surface asperulous. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, subterete, 6–8 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma surface pubescent. Lemma margins convolute, covering most of palea. Lemma hairs white or tawny. Lemma apex awned, 1 -awned. Principal lemma awn geniculate, recurved at base of limb, 50–70 mm long overall, with twisted column. Column of lemma awn 11–25 mm long, pubescent. Palea 1 length of lemma, without keels.

Flower and Fruit. Anthers 3, 2–2.6 mm long. Stigmas 2.

Distribution (TDWG). Continent. Europe (*), Africa, Australasia.

Region. Northern Europe (*).

Country /Province /State. : GB Aliens (Ryves et al). **Southern Africa.** Western Cape. **Australia.** Western Australia, South Australia. South-West. Southern.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): *L. velvety*. Plant in whole or in part covered with dense short hairs.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations extravaginal. Culms geniculately ascending, 30–80 cm long, 1.5–2 mm diam. Culm-internodes ridged, retrorsely scabrous.

Culm-nodes swollen, pubescent. Lateral branches lacking. Leaf-sheaths tight, ribbed, pubescent, outer margin hairy. Leaf-sheath oral hairs pubescent. Ligule a ciliolate membrane, 0.2–1 mm long, pubescent on abaxial surface, entire or erose, truncate or obtuse. Leaf-blades flat or convolute, 20–40 cm long, 2–3 mm wide, glaucous. Leaf-blade surface ribbed, puberulous, densely hairy, hairy on both sides.

Inflorescence. Inflorescence a panicle. Panicle contracted, linear, 15 cm long, 0.5–2 cm wide. Primary panicle branches 1–3.5 cm long. Panicle axis puberulous. Panicle branches puberulous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, angular, 1–5 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 9–12 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1–2 mm long, pubescent, acute. Floret callus hairs 0.1–0.8 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 9–12 mm long, 1.2–1.4 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface pubescent. Lower glume apex acuminate. Upper glume lanceolate, 6.5–10 mm long, membranous, without keels, 5 -veined. Upper glume surface pubescent. Upper glume apex acute or acuminate.

Florets. Fertile lemma linear, subterete, 5–6.5 mm long, coriaceous, without keel, 5 -veined, more than 3-veined. Lemma surface granulose, pubescent. Lemma margins convolute, covering most of palea. Lemma hairs 1–1.5 mm long. Lemma apex emarginate or acute, awned, 1 -awned. Principal lemma awn bigeniculate, 30–45 mm long overall, with twisted column. Middle segment of lemma awn 3–16 mm long. Column of lemma awn 7–9 mm long, pubescent, with 0.1–0.3 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels. Palea surface pubescent, hairy on back. Palea apex ciliate.

Flower and Fruit. Lodicules 2, 0.8–1.2 mm long. Anthers 3, 1–2 mm long, anther tip smooth. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia.
South-West. Southern.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Joyce Winifred Vickery (1908–1979) Australian botanist.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Annual or perennial, caespitose. Culms 20–45 cm long, 2–2.5 mm diam., 1–2 -noded. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths loose, glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 2.5–8 mm long, lacerate. Leaf-blades flat or conduplicate, 9–18 cm long, 1.5–4 mm wide. Leaf-blade surface ribbed, puberulous, hairy adaxially.

Inflorescence. Inflorescence a panicle, embraced at base by subtending leaf. Panicle open, 9–20 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets linear, subterete, 14–18 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 2.5–3 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma. Lower glume lanceolate, 14–18 mm long, 1.3–1.5 length of upper glume, membranous, without keels, 3 -veined. Lower glume surface asperulous, rough on veins, glabrous or pubescent, hairy between veins. Lower glume apex acuminate. Upper glume lanceolate, 9–14 mm long, membranous, without keels, 5 -veined. Upper glume surface asperulous, rough on veins, glabrous or pubescent, hairy between veins. Upper glume apex acuminate.

Florets. Fertile lemma linear, subterete, 6–7 mm long, coriaceous, dark brown, shiny, without keel, 5 -veined, more than 3-veined. Lemma surface glabrous. Lemma margins convolute, covering most of palea. Lemma apex scabrous, with a short cylindrical neck or surmounted by a ring of hairs, with this appendage 1–1.5 mm long (as to hairs), awned, 1 -awned. Principal lemma awn straight or flexuous or bigenulate,

90–115 mm long overall, without a column or with twisted column. Middle segment of lemma awn 11–14 mm long. Column of lemma awn 15–18 mm long, pubescent, with 0.2–0.3 mm long hairs. Palea 1 length of lemma, 2 -veined, without keels.

Flower and Fruit. Lodicules 3. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp. Hilum linear.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. Western Australia, South Australia.
South-West. Southern.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Wakool Shire, New South Wales, Australia.

Classification. Subfamily Pooideae. Tribe: Stipeae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations extravaginal. Culms erect or geniculately ascending, 1.5–3 mm diam. Culm-internodes terete, distally pubescent or hirsute. Culm-nodes swollen, pubescent. Leaf-sheaths tight, ribbed, pubescent or hirsute, outer margin hairy. Leaf-sheath oral hairs ciliate. Ligule an eciliate membrane, 0.5–0.8 mm long, pilose on abaxial surface, truncate or obtuse. Leaf-blades flat or involute, 20–40 cm long, 1.5–2.5 mm wide. Leaf-blade surface ribbed, grooved adaxially, pubescent, hairy adaxially or on both sides. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 30–36 cm long, 3–5 cm wide. Primary panicle branches spreading, whorled at most nodes, 5–10 cm long. Panicle axis scaberulous. Panicle branches scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, 2–7 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, subterete, 11–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus elongated, 1.5–2 mm long, pubescent, acute.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 11–15 mm long, 1.2–1.4 length of upper glume, membranous, much thinner above, purple, without keels, 3 -veined. Lower glume surface asperulous, rough on veins. Lower glume apex acuminate. Upper glume lanceolate, 9–11 mm long, membranous, much thinner above, purple, without keels, 5 -veined. Upper glume surface asperulous, rough on veins. Upper glume apex acute.

Florets. Fertile lemma oblanceolate, subterete, 5.5–6.5 mm long, coriaceous, dark brown, without keel, more than 3-veined. Lemma lateral veins with distinct primaries but obscure intermediates. Lemma surface tuberculate, rough above, hirsute. Lemma margins convolute, covering most of palea. Lemma hairs white. Lemma apex dentate, 2 -fid, surmounted by a ring of hairs, with this appendage 2–2.5 mm long, awned, 1 -awned. Principal lemma awn from a sinus, bigeniculate, 35–60 mm long overall, with twisted column, limb scabrous. Middle segment of lemma awn 8–15 mm long. Column of lemma awn 7–10 mm long, scabrous. Palea 1 length of lemma, coriaceous, without keels. Palea surface pubescent, hairy on back.

Flower and Fruit. Lodicules 2, 1 mm long. Anthers 3. Stigmas 2. Caryopsis with adherent pericarp, 3–4 mm long. Embryo 0.33 length of caryopsis. Hilum linear, 0.66–0.75 length of caryopsis.

Distribution (TDWG). Continent. Australasia.

Country /Province /State. Australia. New South Wales.
Western Slopes, Western Plains.

Avellinia michelii (Savi) Parl. *Pl. Nouv.* 59 (1842).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online (as *Rostraria festucoides*), U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), D.Sharp, D. & B.K.Simon, *AusGrass* (2002), T.G.Tutin et al, *Flora Europaea* 5 (1980).

Basionym or Replaced Name: *Bromus michelii* Savi, *Bot. Etr.* 1: 78 (1808).

Recent Synonyms: *Rostraria festucoides* (Link) C.RomeroZarco, *Lagascalía*, 18(2): 310: (1996).

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 260), J.P.Jessop, G.R.M. Dashorst & F.M.James, *Grasses of South Australia* (2006) (204, Fig. 152), C.A.Gardner, *Flora of Western Australia*, Vol 1, Part 1, *Gramineae* (1952) (61, Pl. 16), N.Walsh & T.Entwistle, *Flora of Victoria* Vol 2 (1994) (453, Fig. 88), A.Wilson (ed.), *Flora of Australia*, Vol 44A. *Poaceae* (2009) (155, Fig. 23), D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002).

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): in honor of Pier Antonio Micheli (1679–1737) Italian botanist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 7–30 cm long. Culm-internodes distally pubescent. Leaf-sheaths pubescent. Ligule an eciliate membrane, 0.5–1 mm long, truncate. Leaf-blades 2–5 cm long, 1 mm wide.

Inflorescence. Inflorescence a panicle. Panicle contracted, lanceolate, 2–7 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or cuneate, laterally compressed, 3–5 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes definite, pubescent. Floret callus glabrous.

Glumes. Glumes persistent, dissimilar, reaching apex of florets, shiny, gaping. Lower glume linear, 0.7–1.3 mm long, 0.25 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume apex acute. Upper glume elliptic, 3–5 mm long, 1 length of adjacent fertile lemma, membranous, 1-keeled, 3 -veined. Upper glume primary vein scaberulous. Upper glume apex acute.

Florets. Fertile lemma linear, 3–5 mm long, membranous, without keel, 3 -veined, 0–3 -veined. Lemma lateral veins obscure. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn from a sinus, straight, 1–2 mm long overall. Palea gaping, 0.5 length of lemma, hyaline.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 0.5 mm long. Ovary glabrous. Caryopsis with adherent pericarp. Hilum punctiform.

TYPE from Ethiopia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *G.H.W. Schimper 1877*, Ethiopia (K, L).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ica*, belonging to. From Abyssinia, now Ethiopia.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 70–100 cm long, 4 -noded. Lateral branches lacking. Ligule an eciliate membrane, 5–10 mm long, erose. Leaf-blades 15–30 cm long, 6–11 mm wide. Leaf-blade surface scaberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, nodding, 20–40 cm long, 5–15 cm wide. Panicle branches scaberulous. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 20–25 mm long, persistent on plant. Rhachilla internodes pilose, with 1–2 mm long hairs. Floret callus evident, bearded, obtuse.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 20–25 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume elliptic, 20–25 mm long, 1.3 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–18 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface scaberulous, rough above or on veins. Lemma margins eciliate or ciliate. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 36 mm long overall, with twisted column. Column of lemma awn 10–13 mm long. Lateral lemma awns present, arising on apex of lobes, 2–3 mm long, shorter than principal. Palea keels winged, narrowly winged, ciliolate.

Flower and Fruit. Anthers 3, 2 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, 7–8 mm long, hairy all over. Hilum linear.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northeast Tropical Africa. Eritrea, Ethiopia (inc. Eritrea). Arabian Peninsula. Saudi Arabia, Yemen.

Avena aemulans Nevski. *Acta Univ. As. Med. Ser. 8 b, Bot. Fasc.* 17, 5, in clavi. (1934).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. aemulor*, come near to. Rather similar to another species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 30–120 cm long. Leaves cauline. Ligule an eciliate membrane. Leaf-blades 10–45 cm long, 4–18 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, nodding, 10–30 cm long. Primary panicle branches drooping. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–5 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 20–25 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Rhachilla internodes 1.5 mm long. Floret callus elongated, 2–3.5 mm long, obtuse, disarticulating obliquely, with circular scar.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 0.75–0.9 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 1.2–1.4 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–20 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 20–30 mm long overall, with twisted column. Column of lemma awn pubescent.

Flower and Fruit. Anthers 3, 2–2.5 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, hairy all over. Hilum linear.

Distribution (TDWG). Continent. Europe.

Region. Eastern Europe.

Derivation (Clifford & Bostock 2007): L. bearded, barbed. With hairs on the callus, glumes or lemma.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms erect or geniculately ascending, 30–100 cm long. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths pilose. Ligule an eciliate membrane, 1–6 mm long, obtuse. Leaf-blades 6–30 cm long, 2–20 mm wide. Leaf-blade surface glabrous or pilose, sparsely hairy.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, effuse, nodding, 15–30(–50) cm long, 6–12 cm wide. Primary panicle branches 9–18 cm long. Panicle branches smooth or scaberulous. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 16–26 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pilose. Floret callus evident, bearded, obtuse. Floret callus hairs 2–3 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 16–26 mm long, 1 length of upper glume, membranous, without keels, 5(–7) -veined. Lower glume apex acuminate. Upper glume elliptic, 16–26 mm long, 1.3 length of adjacent fertile lemma, membranous, without keels, 7(–9) -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 12–20 mm long, coriaceous, much thinner above, without keel, 9 -veined, more than 3-veined. Lemma surface scabrous, rough above, pilose, hairy below. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 30–60 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 3–12 mm long, shorter than principal. Palea 10–18 mm long. Palea keels ciliate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 60–150 cm long. Culm-nodes glabrous. Lateral branches lacking. Ligule an eciliate membrane, 3–7 mm long. Leaf-blades 15–30 cm long, 2–6 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scabrous.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 15–25 cm long. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 3–4 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 27–30 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus evident, bearded, obtuse, fracturing irregularly, with elliptic scar. Floret callus hairs 3–5.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 25–30 mm long, 1 length of upper glume, membranous, without keels, 7 -veined. Lower glume apex acuminate. Upper glume elliptic, 28–33 mm long, 1.5–1.8 length of adjacent fertile lemma, membranous, without keels, 9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–20 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, with lobes 1.5 mm long, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, straight or curved, 25–33 mm long overall, without a column. Palea 12–15 mm long. Palea keels ciliolate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

$n = 21$ (3 refs TROPICOS). $2n = 40$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia, Australasia (*), Tropical Asia, South America.

Region. Northern Europe (*), Southwestern Europe, Southeastern Europe.

Avena chinensis (Fisch. ex Roem. & Schult.) Metzg. *Europ. Cereal.* :53 (1824).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

Basionym or Replaced Name: *Avena nuda* var. *chinensis* Fisch. ex Roem. & Schult., *Syst Veg.* 2:669 (1817).

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 443).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From China.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 45–90 cm long. Culm-nodes glabrous. Leaves cauline. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades 10–20 cm long, 3–7 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, 15–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 3–6 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 25–35 mm long, persistent on plant. Rhachilla internodes glabrous. Floret callus glabrous.

Glumes. Glumes similar, shorter than spikelet, similar to fertile lemma in texture. Lower glume lanceolate, 15–25 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 15–25 mm long, 0.9–1 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile florets all alike or with the lowest dissimilar. Lowest fertile lemma muticous or awned (15–20mm). Fertile lemma lanceolate, 18–25 mm long, membranous, without keel, 7–9 -veined, more than 3-veined. Lemma lateral veins distinct. Lemma surface glabrous. Lemma apex dentate, 2–4 -fid, muticous.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, 8 mm long, hairy all over. Hilum linear. Disseminule comprising a caryopsis.

Distribution (TDWG). Continent. Europe, Temperate Asia.

Region. Middle Europe, Southwestern Europe, Eastern Europe.

Country /Province /State. Belarus, Baltic States, Central European Russia, North European Russia, South European Russia, Northwest European Russia, Moldova, Ukraine. Derivation (Clifford & Bostock 2007): L. defective. Leaf-blades spirally twisted.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, culms solitary or caespitose. Culms erect or geniculately ascending, 13–60 cm long. Culm-internodes glaucous. Lateral branches lacking. Leaf-sheaths glabrous on surface or pilose. Ligule an eciliate membrane, 1.8–3 mm long, obtuse. Leaf-blades 3–10 cm long, 2–4 mm wide. Leaf-blade surface glabrous or pilose.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, nodding, 6–15 cm long, 4–6 cm wide. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 3–5 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 18–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse, disarticulating obliquely. Floret callus hairs 4–4.5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 11–15 mm long, 0.5–0.66 length of upper glume, membranous, without keels, 3–5 -veined. Lower glume apex acuminate. Upper glume elliptic, 20–25 mm long, 1–1.3 length of adjacent fertile lemma, membranous, without keels, 7 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 20 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface glabrous or pilose, hairy above. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.33–0.5 way up back of lemma, geniculate, 30 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 7 mm long, shorter than principal. Palea keels ciliolate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

Derivation (Clifford & Bostock 2007): L. tasteless. Grain not favored as food.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculate ascending, 30–150 cm long, 3–5-noded. Leaves cauline. Ligule an eciliate membrane, 4–6 mm long. Leaf-blades 10–45 cm long, 3–15 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, nodding, 10–40 cm long, 5–20 cm wide. Primary panicle branches drooping. Panicle branches scaberulous. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 18–28 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus evident, bearded, obtuse, disarticulating obliquely. Floret callus hairs 0.2 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 18–28 mm long, 1 length of upper glume, membranous, without keels, 7–11 -veined. Lower glume apex acuminate. Upper glume lanceolate, 18–28 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, without keels, 7–11 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 14–20 mm long, coriaceous, much thinner above, dark brown, without keel, 7–9 -veined, more than 3-veined. Lemma surface pilose, hairy below. Lemma apex dentate, 2–4 -fid, with irregular lobes, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 25–40 mm long overall, with twisted column. Palea keels ciliate.

Flower and Fruit. Anthers 3, 3 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, 6–8 mm long, hairy all over. Hilum linear.

Illustrations (Books): N.Feinbrun-Dothan, *Flora Palaestina* 4 (1986) (Pl. 248).

Derivation (Clifford & Bostock 2007): *L. longus*, long; *gluma*, husk. Spikelets with long glumes and or lemmas.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 30–120 cm long. Lateral branches lacking. Ligule an eciliate membrane, obtuse. Leaf-blades 15–25 cm long, 5–10 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, linear, equilateral or nodding, 10–15 cm long. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 25–40 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus elongated, 5 mm long, bearded, acute, disarticulating obliquely, with linear scar.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 25–40 mm long, 1 length of upper glume, membranous, without keels, 9–11 -

veined. Lower glume apex acuminate. Upper glume elliptic, 25–40 mm long, 1.3 length of adjacent fertile lemma, membranous, without keels, 9–11 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 20–35 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface pilose. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 40–60 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 10–15 mm long, shorter than principal. Palea keels ciliolate. Palea surface smooth or scaberulous.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

$2n = 14$ (4 refs TROPICOS).

Distribution (TDWG). Continent. Europe, Africa, Temperate Asia.

Region. Southwestern Europe.

Country /Province /State. : Portugal, Sardinia, Spain. **Northern Africa.** Algeria, Egypt, Libya, Morocco, Tunisia. **Western Asia.** Palestine, Israel & Jordan.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating location. From Morocco.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 50–100 cm long. Lateral branches lacking. Ligule an eciliate membrane, acute. Leaf-blades 15–30 cm long, 2–5 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 20–30 cm long. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 30–40 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus evident, bearded, obtuse, disarticulating transversely or disarticulating obliquely, with circular scar or elliptic scar.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 30–40 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume elliptic, 30–40 mm long, 1.3 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 20–30 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface villous. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 20–30 mm long overall, with twisted column. Palea keels ciliolate. Palea surface pubescent, hairy on back.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northern Africa. Morocco.

Avena murphyi Ladizinsky. *Israel J. Bot.*, 20(1): 24 (1971).

TYPE from Spain. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Algeciras to Cadiz: Ladizinsky & Zohary (HUI holo, K).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of H.C. Murphy (fl. 1968) United States plant breeder.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 50–100 cm long. Lateral branches lacking. Ligule an eciliate membrane, acute. Leaf-blades 15–30 cm long, 5–8 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, 20 cm long. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 30–40 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus evident, bearded, obtuse, disarticulating transversely or disarticulating obliquely, with circular scar or elliptic scar.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 30–40 mm long, 1 length of upper glume, membranous, without keels, 9–11 -veined. Lower glume apex acuminate. Upper glume elliptic, 30–40 mm long, 1.3 length of adjacent fertile lemma, membranous, without keels, 9–11 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 20–30 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.25 way up back of lemma, geniculate, 40–60 mm long overall, with twisted column. Palea keels ciliolate. Palea surface scaberulous.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

Distribution (TDWG). Continent. Europe.

Region. Southwestern Europe.

Country /Province /State. : Spain.

Avena nuda Linn. *Demonstr. Pl.* 3 1753.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), S-L Chen et al, *Flora of China* 22 (Poaceae) (2006), T.G.Tutin et al, *Flora Europaea* 5 (1980), N.Tsvelev, *Grasses of the Soviet Union* (1983).

T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: (LINN-95.8). LT designated by Cope in Cafferty et al., *Taxon* 49(2): 247 (2000); the earlier lectotypification by Baum (1974, 1978) is ineffective because it was based on an ineligible S specimen [see Cafferty et al., *Taxon* 49(2): 247 (2000)].

Illustrations (Books): S-L Chen et al, *Flora of China*, Illustrations, Poaceae (2007) (Fig. 445).

Derivation (Clifford & Bostock 2007): L. bare. Lemmas glabrous.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 45–90 cm long. Culm-internodes distally pruinose. Leaves cauline. Ligule an eciliate membrane, 2–4 mm long. Leaf-blades 10–20 cm long, 3–7 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, linear or lanceolate, 15–25 cm long. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–4 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 20–25 mm long, persistent on plant. Floret callus glabrous.

Glumes. Glumes similar, shorter than spikelet, thinner than fertile lemma. Lower glume lanceolate, 20–30(–35) mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 15–20 mm long, 0.8–1 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–20 mm long, coriaceous, much thinner above, without keel, 7–9 -veined, more than 3-veined. Lemma surface glabrous. Lemma apex dentate, 2 -fid, with lobes 1–3(–4) mm long, lobes acuminate, awned, 1 -awned. Principal lemma awn dorsal, curved, 15–20 mm long overall. Palea 0.5 length of lemma.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, hairy all over. Hilum linear.

$2n = 42$ (5 refs TROPICOS).

Avena prostrata Ladizinsky. *Israel J. Bot.* 20(4): 297 1971.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, T.G.Tutin et al, *Flora Europaea* 5 (1980).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. prostrato*, throw to the ground. Culms creeping or wiry so as to fall on the ground.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms prostrate, 15–50 cm long. Leaf-sheaths glabrous on surface. Ligule an eciliate membrane. Leaf-blades 2–4 mm wide.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, nodding, 10–20 cm long. Primary panicle branches spreading. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 12–15 mm long, breaking up at maturity, disarticulating below each fertile floret. Floret callus glabrous, disarticulating obliquely.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 12–15 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 12–15 mm long, 1–1.1 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 11–15 mm long, coriaceous, much thinner above, yellow or grey, without keel, 7 -veined, more than 3-veined. Lemma surface pilose. Lemma apex dentate, 2–4 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 20–35 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 2–4 mm long, shorter than principal. Palea keels ciliolate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, hairy all over. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). **Continent.** Europe.

Derivation (Clifford & Bostock 2007): L. cultivated. Crop species.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect, 40–180 cm long. Leaves cauline. Ligule an eciliate membrane, 3–6 mm long. Leaf-blades 14–40 cm long, 5–15 mm wide. Leaf-blade surface scaberulous, rough on both sides. Leaf-blade apex acuminate.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, nodding, 20–40 cm long, 5–15 cm wide. Primary panicle branches drooping. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 22–27 mm long, persistent on plant. Floret callus glabrous, disarticulating obliquely.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 22–27 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 22–27 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–17 mm long, coriaceous, much thinner above, without keel, 7–9 -veined, more than 3-veined. Lemma surface scabrous, rough above, glabrous. Lemma apex dentate, 2 -fid, muticous or awned, 0–1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 25–35 mm long overall, with twisted column. Palea keels ciliate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, hairy all over. Hilum linear.

Derivation (Clifford & Bostock 2007): L. sterile. The spikelets fall soon after attaining maturity.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending or decumbent, 30–180 cm long, 2–5 -noded. Leaves cauline. Ligule an eciliate membrane, 3–8 mm long. Leaf-blades 10–60 cm long, 4–18 mm wide. Leaf-blade surface scaberulous, rough adaxially. Leaf-blade margins scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, pyramidal, effuse, nodding, 10–45 cm long, 5–25 cm wide. Primary panicle branches drooping. Panicle branches scaberulous. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 5–35 mm long.

Fertile Spikelets. Spikelets comprising 2–5 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 23–50 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus evident, bearded, obtuse, disarticulating obliquely. Floret callus hairs 0.15 length of lemma.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 23–50 mm long, 1 length of upper glume, membranous, without keels, 7–11 -veined. Lower glume apex acuminate. Upper glume lanceolate, 23–50 mm long, 1.2–1.4 length of adjacent fertile lemma, membranous, without keels, 7–11 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 15–40 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface scaberulous, rough above, pilose, hairy below. Lemma apex dentate, 2 -fid, awned, 1 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 30–80 mm long overall, with twisted column. Column of lemma awn hispidulous to pubescent. Palea keels ciliate.

Flower and Fruit. Anthers 3, 2.5–4 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, 11–12 mm long, hairy all over. Hilum linear.

Images: D.Sharp & B.K.Simon, *AusGrass*. Grasses of Australia. CD-Rom Version 1.0. (2002);

Derivation (Clifford & Bostock 2007): L. covered with short, bristle-like hairs. One or more organs covered with bristle-like hairs.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculate ascending, 60–120 cm long, 3–5-noded. Leaves cauline. Ligule an eciliate membrane, 2–5 mm long. Leaf-blades 8–25 cm long, 5–10 mm wide. Leaf-blade surface scaberulous.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, nodding, 8–30 cm long, 3–10 cm wide. Primary panicle branches drooping. Panicle branches scaberulous. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets cuneate, laterally compressed, 17–26 mm long, persistent on plant. Floret callus glabrous, disarticulating obliquely.

Glumes. Glumes similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 17–26 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume lanceolate, 17–26 mm long, 1.5–1.6 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 10–17 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma surface scaberulous, rough above, glabrous or pilose, hairy all along or above (when hairy). Lemma apex dentate, 2–4 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 20–35 mm long overall, with twisted column. Lateral lemma awns present, arising on apex of lobes, 3–9 mm long, shorter than principal. Palea keels ciliate.

Flower and Fruit. Anthers 3, 2.5–4 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, hairy all over. Hilum linear.

$n = 8$ (1 ref TROPICOS). $2n = 14$ (8 refs TROPICOS).

Avena vaviloviana (Malzev) Mordv. *Fl. Cult. Pl. USSR* 2: 422 1936.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Ethiopia. **Basionym or Replaced Name:** *Avena strigosa* subsp. *vaviloviana* Malzev, *Bull. Appl. Bot. Pl. Breed. Suppl.* 38:278 (1930). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Asmara: Vavilov 1027 (WIR lecto).

Illustrations (Books): S.Phillips, *Poaceae* (Gramineae) in I.Hedberg & S.Edwards, *Flora of Ethiopia and Eritrea* (1995).

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating connection. In honor of Nikolai Ivanovich Vavilov (1887–1942) Russian plant geneticist.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 80–110 cm long, 3–5-noded. Lateral branches lacking. Leaf-sheaths glabrous on surface or puberulous. Ligule an eciliate membrane, 4–7 mm long, erose. Leaf-blades 15–30 cm long, 5–10 mm wide. Leaf-blade surface scaberulous, glabrous or puberulous. Leaf-blade apex attenuate.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, nodding, 20–40 cm long, 5–15 cm wide. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2–3 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 18–25 mm long, breaking up at maturity, disarticulating below each fertile floret. Rhachilla internodes pilose, with 2–3 mm long hairs. Floret callus evident, bearded, obtuse, disarticulating transversely, with circular scar. Floret callus hairs 1–5 mm long.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 18–25 mm long, 1 length of upper glume, membranous, without keels, 7–9-veined. Lower glume apex acuminate. Upper glume elliptic, 18–25 mm long, 1.5 length of adjacent fertile lemma, membranous, without keels, 7–9-veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 12–15 mm long, coriaceous, much thinner above, without keel, 7-veined, more than 3-veined. Lemma surface scaberulous, rough above or on veins, glabrous or pilose. Lemma apex dentate, 2-fid, awned, 3-awned. Principal lemma awn dorsal, arising 0.5 way up back of lemma, geniculate, 20–30 mm long overall, with twisted column. Column of lemma awn 8–12 mm long. Lateral lemma awns present, arising on apex of lobes, 1–2 mm long, shorter than principal. Palea keels winged, narrowly winged, ciliolate.

Flower and Fruit. Anthers 3, 1–2 mm long. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, 6 mm long, hairy all over. Hilum linear.

$2n = 28$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa.

Country /Province /State. Northeast Tropical Africa. Eritrea, Ethiopia (inc. Eritrea).

Avena ventricosa Balansa. *Bulletin de la Sociéti Botanique de France* 1: 14 1854.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), N.Tsvelev, *Grasses of the Soviet Union* (1983).

TYPE from Algeria. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: LT: *Balansa* 557, 5 Apr 1852, Algeria: Oran Batterie Espagnole Champs (P; ILT: FI, G, K, W). LT designated by ?; cited by Ali Chaudahry, *Grass. Saudi Arabia* 120 (1989).

Illustrations (Books): N.L.Bor, *Gramineae in Flora of Iraq* (1968) (331, Pl. 121).

Derivation (Clifford & Bostock 2007): *L. venter*, belly; *-osa*, abundance. Spikelets inflated.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Annual, caespitose. Culms erect or geniculately ascending, 30–60 cm long. Lateral branches lacking. Ligule an eciliate membrane. Leaf-blades 4–8 cm long, 2–3 mm wide. Leaf-blade surface pilose.

Inflorescence. Inflorescence a panicle. Panicle open, elliptic, nodding, 10–20 cm long. Primary panicle branches indistinct the panicle almost racemose, bearing 1 fertile spikelets on each lower branch. Spikelets pendulous, solitary. Fertile spikelets pedicelled. Pedicels present, filiform.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets lanceolate, laterally compressed, 25–30 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Floret callus elongated, 6–7 mm long, pubescent, pungent.

Glumes. Glumes persistent, similar, exceeding apex of florets, thinner than fertile lemma, gaping. Lower glume lanceolate, 25–30 mm long, 1 length of upper glume, membranous, without keels, 7–9 -veined. Lower glume apex acuminate. Upper glume elliptic, 25–30 mm long, 2–2.5 length of adjacent fertile lemma, membranous, without keels, 7–9 -veined. Upper glume apex acuminate.

Florets. Fertile lemma lanceolate, 10–15 mm long, coriaceous, much thinner above, without keel, 7 -veined, more than 3-veined. Lemma apex dentate, 2 -fid, awned, 3 -awned. Principal lemma awn dorsal, arising 0.33 way up back of lemma, geniculate, 30–35 mm long overall, with twisted column. Column of lemma awn puberulous. Lateral lemma awns present, arising on apex of lobes, 7 mm long, shorter than principal. Palea keels ciliate.

Flower and Fruit. Anthers 3. Ovary pubescent all over. Caryopsis with adherent pericarp, sulcate on hilar side, hairy all over. Hilum linear.

$2n = 14$ (1 ref TROPICOS).

Distribution (TDWG). Continent. Africa, Temperate Asia.

Country /Province /State. Northern Africa. Algeria, Libya. Caucasus, Western Asia, Arabian Peninsula. Iran, Iraq.

Avena volgensis (Vavilov) Nevski. *Trudy Sredne-Aziatskogo Gosudarstvennogo Universiteta. Seriya 8b, Botanika* 17: 5 1934.

Images: R.Darke, *Ornamental Grasses* (2004);, R.Darke, *The Encyclopaedia of Grasses for Liveable Landscapes* (2007);.

Derivation (Clifford & Bostock 2007): awn flexuous.

Classification. Subfamily Pooideae. Tribe: Poeae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or elongated. Culms erect, 20–200 cm long, wiry, 1–3 -noded. Leaves mostly basal. Leaf-sheaths smooth or scaberulous. Ligule an eciliate membrane, 0.5–3 mm long, obtuse. Leaf-blades filiform, involute, 5–20 cm long, 0.3–0.8 mm wide, stiff. Leaf-blade apex abruptly acute or acute.

Inflorescence. Inflorescence a panicle. Panicle open, ovate, effuse, 4–15 cm long, 3–20 cm wide. Panicle branches capillary, scabrous. Spikelets solitary. Fertile spikelets pedicelled. Pedicels present, filiform, 3–10 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 2 fertile florets, with a barren rhachilla extension. Spikelets of 2 or more fertile florets. Spikelets one-many-flowered - if two-flowered then both fertile or the upper sterile. Spikelets oblong or cuneate, laterally compressed, 4–6 mm long, breaking up at maturity, disarticulating above glumes but not between florets. Rhachilla internodes definite, pilose. Floret callus pilose.

Glumes. Glumes persistent, similar, reaching apex of florets, similar to fertile lemma in texture, shiny. Lower glume ovate, 3–5 mm long, 0.8–0.9 length of upper glume, membranous, 1-keeled, 1 -veined. Lower glume lateral veins absent. Lower glume surface smooth or asperulous. Lower glume apex acute. Upper glume elliptic, 4–6 mm long, 1.1–1.2 length of adjacent fertile lemma, membranous, 1-keeled, 1–3 -veined. Upper glume surface smooth or asperulous. Upper glume apex acute.

Florets. Fertile lemma oblong, 3.5–5.5 mm long, membranous, shiny, without keel, 4 -veined, more than 3-veined. Lemma apex erose, truncate or obtuse, awned, 1 -awned. Principal lemma awn dorsal, arising 0.2 way up back of lemma, geniculate, 4–7 mm long overall, with twisted column. Palea keels scaberulous. Rhachilla extension 0.3–0.4 length of fertile floret, pilose.

Flower and Fruit. Lodicules 2, membranous. Anthers 3, 2–3 mm long. Ovary glabrous. Caryopsis with adherent pericarp, 2–2.5 mm long. Hilum punctiform.

Axonopus amapaensis G. A. Black. *Advanc. Front. Pl. Sci.* 5: 104 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: G. A. Black & R. L. Froes 51–12400, 27 Jul 1951, Brazil: Amapa: A beira da estrada de Rodagem, Macapa-Clevelandia entre os Km. 106 e 110 (IAN; IT: US-2237019).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Amapa, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, robust, 75–150 cm long. Culm-nodes pubescent. Lateral branches ample. Leaves cauline. Leaf-sheaths 4–30 cm long, keeled, outer margin hairy. Ligule a ciliolate membrane, 0.7 mm long. Collar pubescent. Leaf-blades persistent or deciduous at the ligule, 5–20 cm long, 5–8 mm wide, firm. Leaf-blade surface glabrous. Leaf-blade margins glabrous or ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–4 peduncles per sheath. Peduncle 30–70 cm long. Racemes 5–9, digitate, ascending or spreading, unilateral, 4–10 cm long. Central inflorescence axis 3–6 cm long. Rhachis angular, 0.3 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5–7 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acute, 1.9 mm long, 0.6–0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 7 -veined. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, prominently veined, pubescent, hairy at apex or at base. Fertile lemma 1.9 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil North.
Para, Amapa, Maranhao, Piaui. Amapa, Amazonas.

Recent Synonyms: *Axonopus aturensis* Lucas, *Bol. Soc. Venez. Cienc. Nat.* 15: 23 (1953).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (56, Fig. 25), E.Judziwicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (86, Fig 12).

Derivation (Clifford & Bostock 2007): L. two-edged. Culms laterally compressed.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 60–200 cm long, 1–2 -noded. Culm-nodes pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 13–30 cm long, hirsute. Ligule a ciliolate membrane, 1 mm long. Leaf-blades erect or ascending, persistent or deciduous at the ligule, conduplicate, 20–50 cm long, 5–10 mm wide, stiff. Leaf-blade surface scabrous, glabrous or hirsute. Leaf-blade apex obtuse, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 15–75 cm long. Racemes numerous, 30–60, borne along a central axis, ascending, unilateral, 4–18 cm long. Central inflorescence axis 15–30 cm long. Rhachis angular, 0.3–0.5 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5–9 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present, reduced to a stump, 0–0.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acute, 1.7–2 mm long, 0.7–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, pubescent, hairy between veins. Fertile lemma 1.5–2 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse or acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

$n = 30$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Axonopus arsenei Swallen. *Journ. Wash. Acad. Sc.* 23: 459 (1933).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bro. Arshne* 6952, 17 Sep 1910, Mexico: Michoacan: Loma Santa Maria, vicinity of Morelia, 2050 m (US-1000427).

Recent Synonyms: *Axonopus elongatus* Swallen, *Contrib. U. S. Nat. Herb.* 29: 414 (1950).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Gustav Joseph Brouard Arshne (1867–1938) cleric and botanist who collected in New Mexico, USA.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 15–75 cm long, 1–2 mm diam., 1–2 -noded. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaves mostly basal. Leaf-sheaths 4–20 cm long. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades ascending, 3–15 cm long, 5–8 mm wide. Leaf-blade surface pilose, densely hairy, hairy adaxially. Leaf-blade apex obtuse, soon splitting.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle straight or nodding, 30–60 cm long. Racemes 2–4, paired or digitate, ascending, unilateral, 4–12 cm long. Central inflorescence axis 0–3 cm long. Rhachis angular, 0.5–0.7 mm wide, glabrous on surface, smooth on margins or scabrous on margins, glabrous on margins. Spikelet packing adaxial, 3–4 spikelets per cm. Raceme-bases brief, pubescent or pilose. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present, 0–0.3 mm long, tip cupuliform.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, acute, 3–3.1 mm long, 1–1.1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, mid-green or purple, 3–5 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, pallid, 3–5 -veined, pubescent, hairy between veins. Fertile lemma ovate, 2.6–2.7 mm long, indurate, yellow, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Central Mexico, Southwest Mexico. **Mesoamerica, Caribbean.** Guatemala.
Mexico State. Jalisco, Michoacan.

Axonopus barbigerus (Kunth) Hitchcock. *Contrib. U. S. Nat. Herb.* 24: 433 (1927).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum barbigerum* Kunth, *Rev. Gram.* 1: 24. (1829). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *F. Sellow s.n. [de Schlechtendal 1827]*, Brazil: Brasilia meridionalis (LE-TRIN-0419.04 (& fig.)). IT?: *F. Sellow 1174*, no date, Brazil (US-2942150 (fragm. ex LE)). OM?: *L. Riedel 2156*, 18-- , Brazil (US-929041).

Recent Synonyms: *Axonopus siccus* (Nees) Kuhlmann, *Comm. Linh. Telegr. Matto Grosso, Amaz. Anexo 5, Bot.* 11: 87 (1922).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (504, Fig. 112), S.A.Renvoize, *The Grasses of Bahia*, 1984 (196, Fig. 74), B.Rosengurt, *Gramineas Uruguayas I* (1970) (290, Fig. 120).

Derivation (Clifford & Bostock 2007): *L. barba*, beard; gero, carry. Spikelets each subtended by a fine rough bristle.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 50–90 cm long, 1–4 -noded. Culm-internodes terete. Leaf-sheaths without keel. Ligule a ciliate membrane, 0.2–0.3 mm long. Leaf-blades erect, curved, conduplicate or involute, 5–40 cm long, 2–7 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 25–50 cm long. Racemes 4–30, borne along a central axis, ascending or spreading, unilateral, 5–15 cm long. Central inflorescence axis 3–15 cm long. Rhachis angular, 0.3–0.4 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6–10 spikelets per cm. Raceme-bases brief, glabrous or pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.2–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse or subacute, 1.6–2.1 mm long, 0.6–0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, ribbed, glabrous or puberulous, hairy between veins. Fertile lemma 1.6–2.1 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Goias, Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana, Catarina, Rio Grande do Sul. Distrito Federal, Mato Grosso, Goiás. Bahia. Paraná.

Axonopus boliviensis S.A. Renvoize. *Gramineas de Bolivia*: 496 (1998).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Beni, Espmritu, *Beck 5211* (HT: LPB).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (497, Fig. 109).

Derivation (Clifford & Bostock 2007): *L. -ense*, denoting origin. From Bolivia.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual. Culms erect or geniculately ascending, 20–45 cm long. Culm-nodes glabrous. Leaves basal and cauline. Leaf-sheaths keeled, glabrous on surface or pilose. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blade base truncate or broadly rounded. Leaf-blades linear or lanceolate, 5–14 cm long, 4–9 mm wide. Leaf-blade surface pilose. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–3 peduncles per sheath. Racemes 2–6, digitate, unilateral, 3–6 cm long. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, 1.3–1.7 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 2–4 -veined. Upper glume primary vein absent. Upper glume margins ciliate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, membranous, 2–4 -veined, without midvein. Fertile lemma elliptic, 1.3–1.7 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Bolivia.

Axonopus brasiliensis (Spreng.) Kuhl. *Comm. Linh. Telegr. Matto Grosso Amaz. Anexo 5*, Bot. 11: 47 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Eriochloa brasiliensis* Spreng., *Syst.* 1: 249 (1825). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: IT: *Otto s.n.*, Brazil (US).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (492, Fig. 108), S.A.Renvoize, *The Grasses of Bahia*, 1984 (193, Fig. 73), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1105, Fig. 218), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (33, Fig. 7).

Derivation (Clifford & Bostock 2007): L. *-ense*, denoting origin. From Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Butt sheaths persistent and investing base of culm, with fibrous dead sheaths. Culms 20–60 cm long. Lateral branches lacking. Leaves mostly basal. Ligule a fringe of hairs. Leaf-blades flat or convolute, 10–23 cm long, 1–2 mm wide. Leaf-blade surface pilose, hairy adaxially. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex obtuse or acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–3, paired or digitate, unilateral, 3–11 cm long. Rhachis angular, 0.3 mm wide, ciliate on margins. Rhachis hairs white. Spikelet packing adaxial, lax, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acute, 2.5–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume lateral veins thickened. Upper glume surface villous, with tubercle-based hairs. Upper glume hairs white. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 5 -veined, with thickened veins, villous, with tubercle-based hairs, bearing white hairs, bearing hairs 1–4 mm long, acute. Fertile lemma ovate, 2–3 mm long, coriaceous, dark brown, without keel. Lemma margins involute. Lemma apex acute. Palea involute, coriaceous.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Goiás, Bahia, Maranhao, Piaui, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana, Catarina, Rio Grande do Sul. Distrito Federal, Mato Grosso, Goiás. Bahia. Amazonas. Minas Gerais, Sao Paulo. Paraná, Rio Grande do Sul, Santa Catarina.

Axonopus bryoides G.H.Rua, R.C.Oliveira & Valls) A.Lopez & O.Morrone. *Syst. Bot.* 37(3): 675 (2013).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. **Basionym or Replaced Name:** *Ophiochloa bryoides* G.H.Rua, R.C.Oliveira & Valls, *Syst. Bot.* 31(3): 493 (-496; fig. 1) (2006). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Brazil, Goias, Chapada dos Veadeiros: Rua & Oliveira 641 (CEN holo, BAA, L, RB, US).

Illustrations (Journals): *Systematic Botany* (31: 494 (2006)).

Derivation (Clifford & Bostock 2007): Gk *bryon*, moss; *-oides*, resembling. Habit moss-like.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual, mat forming, clumped densely. Culms geniculately ascending, 3–6.5 cm long, 0.12 mm diam., 4–5 -noded. Culm-internodes distally glabrous. Culm-nodes purple, glabrous. Leaf-sheaths open for most of their length, 6–12 cm long, without keel, ribbed, glabrous on surface. Ligule a fringe of hairs. Leaf-blades curved, filiform, conduplicate, 2–3 cm long, 0.2–0.3 mm wide. Leaf-blade venation with 3 secondary veins. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes. Peduncle 0.8–3 cm long, glabrous. Racemes 1, single, drooping, unilateral, 0.8–2 cm long. Rhachis narrowly winged, folded longitudinally to embrace spikelets, 0.3–0.4 mm wide, terminating in a barren extension. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 1.4–1.6 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1.4–1.8 mm long, 1 length of spikelet, hyaline, without keels. Upper glume surface asperulous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret unlike other scales, lanceolate, 1.5–2 mm long, 0.6–0.8 length of spikelet, hyaline, light brown, 2 -veined, without midvein, distinctly veined, ciliate on margins, fringed above and below, bearing hairs 0.2–0.9 mm long, emarginate, awned. Awn of lower sterile floret terminal (on one lobe), 4.5–6 mm long. Fertile lemma ovate, dorsally compressed, 1.2–1.3 mm long, membranous, dark brown, without keel. Lemma margins flat, covering most of palea. Lemma apex acute. Palea 2 -veined. Palea apex dentate, 2 -fid.

Flower and Fruit. Anthers 2, 0.5–0.6 mm long. Caryopsis with adherent pericarp, oblong or ovoid, 0.7–0.8 mm long. Embryo 0.33–0.5 length of caryopsis. Hilum elliptic, 0.25 length of caryopsis.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.
Goias.

Axonopus camargoanus Bastos. *Bol. Mus. Paraense Emilio Goeldi, N.S., Bot.* 6(1): 137. 1990[1991].

TYPE from Brazil. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: Brazil: Para: Maraba, Serra dos Carajas, n1, 25 km NW of camp at Serra Norte, aprox. 5.54S 50.27W, marshy area and nearby scrub on outcrop of ferrous rock, 13 Dec. 1981, *Daly, Callejas et al.* 1990 (HT: MG).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Felisberto C. Camargo (c. 1887) Brazilian agriculturalist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Cataphylls evident. Culms 20–35 cm long, 1 -noded. Culm-nodes pubescent. Leaves mostly basal. Leaf-sheaths 3–8 cm long, outer margin hairy. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades filiform or linear, involute, 5–15 cm long, 1 mm wide, firm. Leaf-blade surface glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acuminate, pungent.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 5–8 cm long. Racemes 2–4, paired or digitate, erect or ascending, unilateral, 8–12 cm long. Central inflorescence axis 1–3 cm long. Rhachis angular, 0.4–0.5 mm wide, drab, glabrous on surface, smooth on margins,

glabrous on margins. Spikelet packing adaxial, 3.5 spikelets per cm. Raceme-bases brief or linear, 0–15 mm long, pilose. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acute, 3.1–3.2 mm long, 1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2 length of fertile lemma, 1 length of spikelet, 7 -veined, pubescent, hairy between veins, with conspicuous apical hairs, bearing hairs 0.5 mm long. Fertile lemma 2.5–2.6 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil North.

Para, Amapa. Distrito Federal. Amapa, Pará.

Axonopus canescens (Nees) Pilger. Engl. & Prantl, *Nat. Pflanzenfam. Aufl.* 2, 14 e. 55 (1940).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum canescens* Nees ex Trin., Trin., *Gram. Pan.* :89 (1826). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.H. von Langsdorff s.n.*, Dec, Brazil (LE; IT: K, US-2942166 (fragm. ex B, LE)).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (492, Fig. 108).

Derivation (Clifford & Bostock 2007): *L. canesco*, grow white. Leaf-blades or leaf-sheaths densely invested with white or grey hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Culms 30–100 cm long. Culm-internodes distally glabrous. Leaves cauline, without demarcation between sheath and blade. Leaf-sheaths outer margin glabrous or hairy. Ligule a ciliolate membrane, 0.2–0.7 mm long. Leaf-blades ascending, flat or conduplicate, 10–31 cm long, 2–8 mm wide. Leaf-blade surface glabrous or pilose, densely hairy, hairy adaxially.

Inflorescence. Inflorescence composed of racemes, with 1–3 peduncles per sheath. Peduncle 6–20 cm long, glabrous. Racemes 3–14(–22), digitate, unilateral, 6–14 cm long. Central inflorescence axis 1–4(–6) cm long. Rhachis angular, 0.7–0.8 mm wide, tuberculate on margins, ciliate on margins. Rhachis hairs yellow, 2–3 mm long. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or obovate, dorsally compressed, 1.3–1.7 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, yellow or light brown, without keels, 2–3 -veined. Upper glume primary vein absent or distinct. Upper glume surface glabrous or pubescent, hairy on veins. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, membranous, yellow or light brown, 2–3 -veined, without midvein or with evident midvein, glabrous or pubescent, hairy on veins, obtuse. Fertile lemma elliptic, 1.3–1.7 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. French Guiana, Guyana, Surinam, Venezuela. Bolivia, Colombia. Brazil North. Distrito Federal, Goiás, Mato Grosso do Sul. Pará. Minas Gerais, Sao Paulo.

Axonopus capillaris (Lam.) Chase. *Proc. Biol. Soc. Washington* 24: 133 (1911).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from French Guiana. **Basionym or Replaced Name:** *Paspalum capillare* Lam., *Illustr.* 1: 176. (1791). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *L.C.M. Richard s.n.*, no date, French Guiana: Cayenne (P-LA; IT: US-2942169 (fragm.)).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (196, Fig. 74), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (58, Fig. 29).

Derivation (Clifford & Bostock 2007): *L. capillis*, a hair; *-are*, pertaining to. Inflorescence with filiform branches.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual, caespitose. Culms geniculately ascending or decumbent, weak, 20–40 cm long, 0.5–0.7 mm diam. Culm-internodes thin-walled. Culm-nodes glabrous or pubescent. Lateral branches ample. Leaf-sheaths glabrous on surface, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long. Leaf-blades linear or lanceolate, 1.5–7 cm long, 3–7 mm wide. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle 7–15 cm long. Racemes 2, paired, unilateral, 2–3.5 cm long. Rhachis angular, 0.3–0.5 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate, dorsally compressed, 1.2–1.6 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 4 -veined. Upper glume primary vein absent. Upper glume surface puberulous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 2 -veined, without midvein, puberulous. Fertile lemma elliptic, 1.2–1.6 mm long, indurate, light brown, without keel. Lemma surface striate. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Anthers 3, 0.4 mm long, purple. Caryopsis with adherent pericarp, ellipsoid, 1.1 mm long.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Casiquiare Department, Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, mat forming. Stolons present, with alternating elongated and bunched internodes. Culms 24–90 cm long, 1 mm diam., 1–2 -noded. Culm-internodes elliptical in section, thin-walled, distally glabrous. Culm-nodes glabrous or pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 3–12 cm long, without keel, glabrous on surface. Leaf-sheath oral hairs ciliate, 1–3 mm long. Ligule a ciliate membrane, 0.1–0.2 mm long. Leaf-blades flat or convolute, 7–60 cm long, 1–3 mm wide. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Racemes 2–3(–5), paired or digitate, erect or ascending or spreading, unilateral, 4–14.5 cm long. Central inflorescence axis 0.2–3 cm long. Rhachis angular, 0.3–0.5 mm wide, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 4–6 spikelets per cm, regular, 2 -rowed. Raceme-bases pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, obtuse, 2.7–3.7 mm long, 0.8–1.3 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, exceeding apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 5–7 -veined. Upper glume lateral veins prominent. Upper glume surface glabrous to pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, 5–7 -veined, prominently veined, glabrous to pubescent, hairy between veins. Fertile lemma elliptic, 2.5–3.5 mm long, indurate, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Lodicules 2, fleshy, veined. Anthers 3, 1.5–2.2 mm long, purple. Caryopsis with adherent pericarp, ellipsoid or obovoid. Embryo 0.5 length of caryopsis. Hilum punctiform.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

Axonopus caulescens (Mez) Henrard. *Blumea* 4: 510 (1941).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guyana. **Basionym or Replaced Name:** *Paspalum caulescens* Mez, *Engl. Jahrb.* 56 Beibl. 125, 10 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: E. Ule 8533, Dec 1903, Guyana: Mazaruni-Potaro: Amazonas Expedition, am Ufer eines Baches beim Dorfe Roraima, 1200 m (B; IT: IAN, K, L, MG, U, US-2942172 (fragm. ex B & photo), US-91016 (fragm. ex K)).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (59, Fig. 30).

Derivation (Clifford & Bostock 2007): *L. caulesco*, develop a stem. Culms stout and leafy.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Stolons present. Basal innovations flabellate. Culms 30–60 cm long. Culm-internodes terete. Culm-nodes glabrous or pubescent. Lateral branches ample. Leaf-sheaths 3–5 cm long. Ligule a ciliolate membrane, 1 mm long. Leaf-blades straight or curved, persistent or deciduous at the ligule (lower leaves), flat or conduplicate, 3–5 cm long, 2.5–3 mm wide, firm. Leaf-blade surface pilose, hairy on both sides. Leaf-blade margins tuberculate-ciliate, hairy at base. Leaf-blade apex abruptly acute, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 1–3 peduncles per sheath. Peduncle 10–35 cm long. Racemes 2–4, paired or digitate, ascending, unilateral, 3–9 cm long. Central inflorescence axis 0–1 cm long. Rhachis angular, 0.3 mm wide, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 5–5.5 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, obtuse, 2.3–2.7 mm long, 0.6–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, dark brown, 7 -veined. Upper glume surface pubescent, hairy between veins, with an apical beard. Upper glume hairs 0.5 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, dark brown, 5–7 -veined, puberulous, hairy between veins. Fertile lemma 2.3–2.7 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. Guyana, Venezuela. Brazil North. Roraima. Roraima.

Axonopus centralis Chase. *Journ. Wash. Acad. Sc.* 17: 143 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 7928, 28 Aug 1911, Panama: Canal Zone: Culebra to Pedro Miguel, along railway, no runners, among grass, open grassland (US-928831; IT: MO-3701230).

Recent Synonyms: *Axonopus rivularis* G. Black, *Mem. N. Y. Bot. Gard.* 9: 250 (1957).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (85, Fig. 24).

Derivation (Clifford & Bostock 2007): *L. centrum*, centre of a circle; -ale, pertaining to. From Central America.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, 35–80 cm long, 1.5–3 mm diam. Culm-internodes solid. Culm-nodes glabrous or pubescent. Lateral branches lacking. Leaf-sheaths longer than adjacent culm internode, keeled, outer margin hairy. Ligule a ciliolate membrane, 0.2–0.8 mm long. Collar pubescent. Leaf-blades 8–50 cm long, 8–13 mm wide. Leaf-blade surface pubescent, sparsely hairy, hairy adaxially.

Inflorescence. Inflorescence composed of racemes. Peduncle nodding, 10–27 cm long, pubescent above. Racemes 2–3, paired or borne along a central axis, unilateral, 7–13 cm long. Central inflorescence axis 3–6 cm long. Rhachis angular, 0.7 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, compressed strongly, 3.4–3.6 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 3 -veined. Upper glume lateral veins excurrent. Upper glume margins pubescent. Upper glume apex dentate, 3 -fid.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 3 -veined, pubescent on margins, acute. Fertile lemma elliptic, 1.9–2.2 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Anthers 3, 0.6 mm long. Caryopsis with adherent pericarp, ellipsoid, 1.4–1.6 mm long.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. Mexico. Southwest Mexico, Southeast Mexico. **Mesoamerica, Northern South America, Western South America, Brazil.** Costa Rica, El Salvador, Guatemala, Honduras, Nicaragua, Panama. Venezuela. Colombia, Ecuador. Brazil Northeast, Brazil North.

Para, Amapa. Paraíba. Amazonas, Pará. Colima, Guerrero, Jalisco, Nayarit. Chiapas.

Axonopus chaseae G. A. Black. *Advanc. Front. Pl. Sci.* 5: 157 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Chase 11232, Mar 1930, Brazil: Minas Gerais: Uberlandia (Uberabinha), sandy clay campo, alt. 850–870 m, erect small tufts (US-1448612; IT: MO-3326812).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Mary Agnes Merrill Chase (1869–1963) United States agrostologist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes short, scaly. Culms erect, 45–50 cm long, 1 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 2–15 cm long, keeled. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades ascending, straight or curved, conduplicate, 2–30 cm long, 1–2 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 5–7 cm long. Racemes 3–5, digitate, ascending, unilateral, 3–9 cm long. Central inflorescence axis 0.4–2 cm long. Rhachis angular, 0.4 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 3.5–4 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.3–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acute, 2.2–2.5 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma, gaping. Upper glume 1 length of spikelet, membranous, 3–5 -veined. Upper glume margins tuberculate, ciliate.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 3–5 -veined, tuberculate on margins, ciliate on margins. Fertile lemma 2.2–2.5 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Bahia. Minas Gerais.

Axonopus chimantensis G. Davidse. *Ann. Missouri Bot. Gard.* 74(2): 418 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolmvar: Distrito Piar: Macizo del Chimanta, sector centro-noreste del Chimanta-tepui, cabeceras orientales del Caño Chimanta, vegetación Litsfitá y ribereña alrededor del comienzo E del Cañon recto del Rmo Chimanta superior, ca. 5.18N 62.09W, ca. 2000 m, 26–29 Jan 1983, O. Huber & J. A. Steyermark 6931 (HT: MO; IT: K, NY, US, VEN).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Maizo del Chimanta District, Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms 25–60 cm long, 1–2 mm diam., 1(–2) -noded. Culm-internodes elliptical in section, thin-walled, distally glabrous or pubescent (in lines). Culm-nodes pubescent. Lateral branches lacking. Leaf-sheaths 3–9 cm long, with winged keel, outer margin hairy. Ligule a ciliate membrane, 0.2–0.4 mm long. Collar pubescent. Leaf-blades conduplicate, 6–18 cm long, 3.5–5 mm wide. Leaf-blade surface scabrous, glabrous or pubescent, sparsely hairy, hairy adaxially. Leaf-blade margins ciliate. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Racemes 2–4, digitate, spreading, unilateral, 2.5–10 cm long. Central inflorescence axis 0.5–1.8 cm long. Rhachis angular, 0.5–0.8 mm wide, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 4–5 spikelets per cm, regular, 2 -rowed. Raceme-bases pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, obtuse, 3–3.4 mm long, 0.9–1.1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, exceeding apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of spikelet, 5 -veined, puberulous, hairy between veins. Fertile lemma elliptic, 2.7–3 mm long, indurate, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Lodicules 2, fleshy. Anthers 3, 1.2–1.5 mm long, purple.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus chrysoblepharis (Lag.) Chase. *Proc. Biol. Soc. Washington* 24 :134 (1911).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Basionym or Replaced Name: *Cabrera chrysoblepharis* Lag., *Gen. et Sp. Nov.* 5 (1816). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ad Panamaimem et Africam Portum, ubi legit cel D. Lud. Nee., *Nee s.n.* (HT: MA?).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (492, Fig. 108), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (57, Fig. 27 as *A. excavatus*), W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (20, Fig 20), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (35, Fig. 8), E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (92, Fig. 13), R.Pilger, *Die Natürlichen Pflanzenfamilien* 14e (1940) (54, Fig. 29).

Illustrations (Journals): *Ruizia* (13:379 Fig 50g-i (1993)).

Derivation (Clifford & Bostock 2007): Gk. *chrysos*, yellow; *blepharon*, eye-lash. Pedicels invested with golden-yellow hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual or perennial, caespitose. Culms erect, 70–100 cm long, 1–2 mm diam. Culm-internodes distally glabrous. Culm-nodes glabrous or pubescent. Lateral branches ample. Leaves cauline. Leaf-sheaths glabrous on surface or hispid, with simple hairs or tubercle-based hairs. Ligule a ciliolate membrane, 0.3–1.2 mm long. Collar glabrous or pubescent. Leaf-blades 5–30 cm long, 5–15 mm wide. Leaf-blade surface hispid, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–2 peduncles per sheath. Racemes 4–10, digitate, unilateral, 4–13 cm long. Central inflorescence axis 1–2 cm long. Rhachis flattened, 1–1.5 mm wide, pilose on surface (on midnerve), ciliate on margins, terminating in a barren extension. Rhachis hairs tawny. Spikelet packing adaxial. Spikelets sunken, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 1.2–1.6 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma oblong, 1.2–1.6 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Anthers 3, 0.5–0.6 mm long. Caryopsis with adherent pericarp.

TYPE from Belize. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.H. Bartlett 11746*, 25 Feb 1931, Belize: Cayo: Mountain Pine Ridge (US-1503594; IT: MO-3701229).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. cilium*, eyelid; *-ata*, possessing; folium, leaf. Leaf-blades hairy.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes elongated, scaly. Culms erect, slender, 50–65 cm long. Culm-internodes terete. Culm-nodes glabrous. Lateral branches lacking. Leaves without demarcation between sheath and blade. Leaf-sheaths 2–6 cm long, outer margin hairy. Ligule a ciliate membrane, 0.1–0.3 mm long. Leaf-blades ascending or spreading, 5–25 cm long, 1–2 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 15–30 cm long. Racemes 2–6, digitate, ascending or spreading, flexuous, unilateral, 5–11 cm long. Central inflorescence axis 2–4 cm long. Rhachis angular, 0.2–0.3 mm wide, drab, glabrous on surface, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 3.5–4.5 spikelets per cm. Raceme-bases brief, glabrous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse, 2.1–2.2 mm long, 0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, hyaline, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma 2.1–2.2 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Belize.

Axonopus comans (Doell) Kuhl. *Com. Linha Telegr. Bot.* 11:87 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum comans* Trin. ex Doell, *Mart. Fl. Bras.* 2(2) 109. (1877). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *F. Sellow s.n.*, Brazil (LE, US-2942141 (fragm. ex B, LE)). 1836 [by pencil].
IT: *Sellow s.n.*, 1818, Brazil: Ribeirao d'Arca (US-2942141).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (65, Fig. 17).

Derivation (Clifford & Bostock 2007): *L. como*, comb the hair and by transfer of meaning the hair itself. Sterile lemma with a terminal tuft of hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, slender, 50–70 cm long, 1–3 -noded. Culm-nodes glabrous or pubescent. Leaves mostly basal. Leaf-sheaths 6–12 cm long, outer margin hairy. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades involute, 15–35 cm long, 0.5–1 mm wide. Leaf-blade apex acuminate, mucicous or pungent, hardened.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 20–50 cm long. Racemes 2–5, digitate, ascending, unilateral, 3–8 cm long. Central inflorescence axis 0.5(–4) cm long. Rhachis angular, 0.2–0.3 mm wide, drab, glabrous on surface, smooth on margins or scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 3–4.5 spikelets per cm. Raceme-bases brief, glabrous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.2–0.3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acuminate, 4–4.5 mm long, 0.9–1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume surface glabrous or puberulous, hairy between veins, without hair tufts or with an apical beard.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2 length of fertile lemma, 1 length of spikelet, 5–7 -veined, glabrous or puberulous, hairy between veins, without hair tufts or with conspicuous apical hairs. Fertile lemma 3.3 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil West Central, Brazil Southeast. Paraguay.

Goiás, Sao Paulo Parana. Distrito Federal, Goiás. Roraima. Minas Gerais, Sao Paulo. Paraná.

Axonopus comatus (Mez) Swallen. *Fieldiana, Bot.*, 28 No. 1, 21 (1951).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum comatum* Mez, Fedde, *Repert.* 15: 67 (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A.F.M. Glaziou 15700*, no date, Brazil: Rio de Janeiro (B; IT: BAA-2065 (fragm. ex B), US-2942140 (fragm. ex B & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. coma*, hair of the head; -ata, possessing. With long hairs imparting a silky appearance to the spikelets.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms 50–100 cm long, 1–3 -noded. Culm-nodes pubescent. Leaf-sheaths hirsute. Ligule a ciliolate membrane. Leaf-blades 20–40 cm long, 6 mm wide, stiff. Leaf-blade surface hirsute. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Racemes 17, digitate, ascending, unilateral, 10–15 cm long. Rhachis angular, 0.5 mm wide, drab, glabrous on surface,

scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4.5 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.6–1 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, subacute or acute, 3.5–3.7 mm long, 1.2–1.4 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 9 -veined. Upper glume surface pubescent, hairy at apex or between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 9 -veined, pubescent, hairy at apex, hairy also on veins. Fertile lemma 1.5–2 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

Minas Gerais, Rio de Janeiro, Espirito Santo. Rio de Janeiro.

Axonopus complanatus (Nees ex Trin.) Dedecca. *Bragantia* 15: 265 (1956).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. complano*, level. Culms flattened.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual. Culms geniculately ascending, 10–75 cm long, 1–2 -noded. Culm-internodes terete. Culm-nodes purple, pubescent. Leaf-sheaths 3–15 cm long, without keel or keeled. Ligule a ciliate membrane, 0.3–0.4 mm long. Leaf-blades 3–20 cm long, 4–10 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 20–45 cm long. Racemes 2–9, paired or digitate, spreading, unilateral, 1.7–2 cm long. Central inflorescence axis 0–3.5 cm long. Rhachis angular, 0.8–1 mm wide, drab, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 5 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 1.7–2 mm long, 0.8–1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, dark green or purple, 2–4 -veined. Upper glume primary vein absent. Upper glume surface puberulous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, dark green or purple, 2–4 -veined, without midvein, puberulous. Fertile lemma 1.7–2 mm long, indurate, light brown or dark brown, shiny, without keel. Lemma margins involute. Lemma apex without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Maranhao, Piaui, Ceara, Rio Grande do Norte, Paraiba, Pernambuco, Alagoas, Sergipe. Mato Grosso, Goiás. Bahia, Ceará, Maranhão, Paraíba, Piaui, Rio Grande do Norte (RN). Sao Paulo.

Derivation (Clifford & Bostock 2007): *L. comprimo*, squeeze together. Culms flattened.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, mat forming. Stolons present. Basal innovations flabellate. Culms decumbent, 15–60 cm long. Culm-nodes pubescent. Leaf-sheaths keeled. Ligule a ciliolate membrane. Leaf-blades linear or lanceolate, flat or conduplicate, 3–20 cm long, 3–12 mm wide. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–5, paired or digitate, unilateral, 3–10 cm long. Rhachis angular, glabrous on surface, glabrous on margins. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, obtuse, 2–2.5 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1.2–1.3 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 4–5 -veined. Upper glume surface glabrous or pubescent, hairy between veins. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1.2–1.3 length of fertile lemma, 1 length of spikelet, 4–5 -veined, pubescent, hairy between veins, acute. Fertile lemma obovate, 1.5–2 mm long, indurate, pallid, without keel, 4 -veined, more than 3-veined. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. $n = 20$ (2 refs TROPICOS). $2n = 40$ (2 refs TROPICOS), or 60 (2 refs TROPICOS).

Axonopus conduplicatus G. A. Black. *Advanc. Front. Pl. Sci.* 5 (*Grasses Gen. Axon.*) 115 (1963).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *A. Chase 10431*, 30 Dec 1929, Brazil: Minas Gerais: 5–10 km W of Diamantina, Serra de San Antonio, alt. 1300–1500 m, sand between boulders, campo (US-1500409).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (193, Fig. 73).

Derivation (Clifford & Bostock 2007): *L. conduplico*, fold. Leaf-sheaths strongly keeled.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes elongated. Culms robust, 70–100 cm long, 1–2 -noded. Culm-nodes pubescent or bearded. Leaves mostly basal, without demarcation between sheath and blade. Leaf-sheaths 6–40 cm long, keeled, pubescent, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades persistent or deciduous at the ligule, 40–80 cm long, 4–6 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex obtuse, asymmetrical.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 10–50 cm long. Racemes 10–20, borne along a central axis, ascending or spreading, unilateral, 5–20 cm long. Central inflorescence axis 6–10 cm long. Rhachis angular, 0.3 mm wide, with scattered hairs or glabrous on surface, smooth on margins or scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4–5.5 spikelets

per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–1 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse, 2.8–3.3 mm long, 1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume lateral veins prominent. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 5–7 -veined, prominently veined, glabrous or puberulous, hairy between veins. Fertile lemma 2.6–2.9 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast, Brazil Southeast.

Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo. Distrito Federal, Goiás. Bahia. Espirito Santo, Minas Gerais.

Axonopus cuatrecasii G. A. Black. *Advanc. Front. Pl. Sci.* 5: 147 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J. Cuatrecasas* 3882, 19 Oct 1938–20 Oct 1938, Colombia: Arauca: Los Llanos, Rmo Casanare, Esmeralada, alt. 130 m, woods and sabana (US-1797918).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Josie Cuatrecasas (1903-) who collected in Colombia.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons absent or present. Culms erect, slender, 80–120 cm long, 2–3 -noded. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaf-sheaths keeled. Ligule a ciliolate membrane, 0.5–1 mm long. Leaf-blades conduplicate, 15–30 cm long, 2–3 mm wide, stiff. Leaf-blade apex obtuse, hooded.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 50 cm long. Racemes 6, digitate, erect or ascending, unilateral, 10–16 cm long. Central inflorescence axis 3 cm long. Rhachis angular, 0.7–0.8 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 7 spikelets per cm. Raceme-bases brief, glabrous. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, acute, 1.7–1.8 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma 1.7–1.8 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Bolivia, Colombia.

Axonopus debilis G. A. Black. *Advanc. Front. Pl. Sci.* 5: 86 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Cuba. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. *Hitchcock 23302*, 26 Nov 1926, Cuba: Pinar del Rmo, first range of hills NW. of Pinar del Rio, pine woods along path were trodden upon (US-1297891).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. weak*. Culms decumbent often much branched at the base.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, slender, 25–30 cm long, 1-noded. Culm-nodes pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 2–7 cm long. Leaf-sheath oral hairs scanty. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades spreading, straight or curved, filiform or linear, flat or involute, 3–7 cm long, 0.7–1.4 mm wide. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–3 peduncles per sheath. Peduncle 5–15 cm long. Racemes 2, paired, ascending, unilateral, 1.7–4 cm long. Central inflorescence axis 0–0.5 cm long. Rhachis angular, 0.3 mm wide, drab, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 4–6 spikelets per cm. Raceme-bases brief, glabrous. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acute, 1.8 mm long, 0.5 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 2–4 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 2–4 -veined, without midvein. Fertile lemma 1.6 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean. Cuba.

Axonopus deludens Chase. *Proc. Biol. Soc. Washington* 24: 134 (1911).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: C.G. *Pringle 8761*, 20 Oct 1903, Mexico: Jalisco: barranca near Guadalajara (US-460803; IT: CM, MO-2875297).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. deludo*, deceive. Not closely related to any other species.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes short, scaly. Culms 100–180 cm long. Leaf-sheaths keeled, glabrous on surface. Ligule a ciliolate membrane. Leaf-blades 15–60 cm long, 8–15 mm wide. Leaf-blade surface hirsute, hairy on both sides. Leaf-blade margins ciliate, hairy at base.

Inflorescence. Inflorescence composed of racemes. Racemes 12–15, digitate, unilateral, 8–15 cm long. Central inflorescence axis 10 cm long. Rhachis angular, glabrous on surface, scaberulous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 2.2–2.9 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet or reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 0.9–1 length of spikelet, membranous, without keels. Upper glume primary vein absent or distinct. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet. Fertile lemma elliptic, 2.2–2.9 mm long, indurate, light brown, shiny, without keel. Lemma margins involute. Lemma apex acute. Palea involute, indurate.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Southwest Mexico. Jalisco, Nayarit.

Axonopus elegantulus (Presl) Hitchcock. *Contrib. U. S. Nat. Herb.* 24: 433 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Paspalum elegantulum* J. Presl, *Rel. Haenk.* 1: 211. (1830). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Haenke s.n.*, no date, Peru (PR; IT: BAA-310 (fragm. ex B), US-2854680 (fragm. ex B, PR & photo)).

Recent Synonyms: *Axonopus attenuatus* (Presl) Hitchcock, *Contrib. U. S. Nat. Herb.* 22: 471 (1922).

Illustrations (Journals): *Ruizia* (13:384 Fig 51a-b (1993)).

Derivation (Clifford & Bostock 2007): *L. elegans*, elegant; *-ulus*, diminutive. Of attractive appearance.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, culms solitary or caespitose. Stolons present. Culms 25–75 cm long. Culm-nodes glabrous. Leaves without demarcation between sheath and blade. Leaf-sheaths 2–25 cm long, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long. Leaf-blades 5–25 cm long, 3–5 mm wide, stiff. Leaf-blade surface glabrous or pilose. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–60 cm long. Racemes 2–12, digitate, ascending or spreading, unilateral, 3–10 cm long. Central inflorescence axis 0–3 cm long. Rhachis angular, 0.4–0.6 mm wide, dark-coloured (green or purple), glabrous on surface, scabrous on margins, ciliate on margins. Rhachis hairs 0.3–1.5 mm long. Spikelet packing adaxial, 5.5–7.5 spikelets per cm. Raceme-bases brief, hirsute. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.2–0.5 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse or subacute, 1.8–2.5 mm long, 0.6–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, mid-green or purple, 2–3 -veined. Upper glume primary vein absent or obscure.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, mid-green or purple, 2–3 -veined, without midvein or with obscure midvein. Fertile lemma 1.8–2.5 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Bolivia, Ecuador, Peru. Brazil North.

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (196, Fig. 74).

Derivation (Clifford & Bostock 2007): *L. emineo*, stand out. Conspicuous with respect to inflorescence.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes absent or short. Butt sheaths withering or persistent and investing base of culm, with fibrous dead sheaths. Culms robust, 100–200 cm long, 3–8 -noded. Culm-nodes glabrous or pubescent or bearded. Leaves cauline. Leaf-sheaths 15–40 cm long, without keel. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.4–0.5 mm long. Leaf-blade base tapering to the midrib. Leaf-blades conduplicate, 10–100 cm long, 4–15 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface glabrous. Leaf-blade apex acuminate, hardened.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 40–70 cm long. Racemes numerous, 20–50, borne along a central axis, ascending, unilateral, 9–12 cm long. Central inflorescence axis 10–30 cm long. Rhachis angular, 0.3–0.4 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5–9 spikelets per cm. Raceme-bases brief. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, subacute, 1.7–2.1 mm long, 0.5–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1–1.1 length of fertile lemma, 1 length of spikelet, 5 -veined, ribbed, glabrous or puberulous, hairy between veins. Fertile lemma linear, 1.7–2 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Surinam, Venezuela. Bolivia. Brazil West Central, Brazil Northeast.

Mato Grosso, Goias, Bahia. Mato Grosso, Goiás. Bahia.

Axonopus equitans Hitchcock & Chase. *Contrib. US. Nat. Herb.* 18: 301 (1917).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Trinidad. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 9988, 27 Nov 1912, Trinidad and Tobago: Trinidad: Fort George Road, Port of Spain, grassland (US-865560).

Recent Synonyms: *Axonopus oteroi* G. A. Black, *Advanc. Front. Pl. Sci.* 5: 126 (1963).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. equito*, ride. Leaves distinctly equitant.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms 45 cm long, 2 -noded. Culm-nodes pubescent. Leaf-sheaths 5–40 cm long, keeled, pilose. Ligule a ciliolate membrane, 0.5–0.6 mm long. Leaf-blades 5–20 cm long, 4–10 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface smooth, pilose. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 15–30 cm long. Racemes 4, digitate, ascending, unilateral, 8–15 cm long. Central inflorescence axis 4–5 cm long. Rhachis angular, 0.4 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, compressed slightly, obtuse, 2.3–2.4 mm long, 1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 5 -veined. Upper glume lateral veins obscure or distinct. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, purple, 5 -veined, obscurely veined or distinctly veined, pubescent, hairy between veins. Fertile lemma 2.1–2.2 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Caribbean, Northern South America, Brazil. Trinidad-Tobago. French Guiana, Guyana, Surinam, Venezuela. Brazil North.

Distrito Federal.

Axonopus fastigiatus (Nees) Kuhl. *Comm. Linh. Telegr. Matto Grosso, Amaz. Anexo 5*, Bot. 11: 87 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum fastigiatum* Nees ex Trin., *Gram. Panic.* 100. (1829). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *l. am* Nees ab *Esenb.*, Brazil: Minas Gerais (LE-TRIN-0455.01; IT: US-929070 (fragm. ex LE), US-2855332 (fragm. ex M)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003), S.A.Renvoize, *The Grasses of Bahia*, 1984 (193, Fig. 73).

Derivation (Clifford & Bostock 2007): *L. fastigio*, sharpen to a point. Panicle branches or culms held erect.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or elongated. Butt sheaths thickened and forming a bulb, persistent and investing base of culm, with fibrous dead sheaths. Culms 25–75 cm long. Culm-nodes glabrous. Lateral branches sparse, arising from lower culm. Leaf-sheaths 1–5 cm long, pubescent. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blades flat or conduplicate, 3–8 cm long, 1–2 mm wide. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade margins ciliate. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1 peduncles per sheath. Peduncle 10–20 cm long. Racemes 1–2, single or paired, erect or ascending, straight, unilateral, 3–8 cm long. Central inflorescence axis 0 cm long. Rhachis angular, 0.5–1 mm wide, dark-coloured (grey), glabrous on surface, smooth on margins or scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 4–6 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acuminate, 3.2–4.5 mm long, 0.5–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2–4 -veined. Upper glume primary vein absent. Upper glume margins ciliate. Upper glume hairs 0.5–2 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1–1.5 length of fertile lemma, 1 length of spikelet, 2–4 -veined, without midvein. Fertile lemma 3 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex acuminate, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast, Brazil Southeast. Goias, Bahia, Minas Gerais, Rio de Janeiro, Espirito Santo. Goiás. Bahia. Minas Gerais.

Images: D.Sharp & B.K.Simon, *AusGrass. Grasses of Australia. CD-Rom Version 1.0.* (2002);

Derivation (Clifford & Bostock 2007): *L. fissum*, cleft; folium leaf. Apex of leaf-blade sometimes bifid.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, mat forming. Rhizomes short. Stolons absent or present. Basal innovations flabellate. Culms 10–60 cm long. Culm-nodes glabrous. Leaf-sheaths keeled. Ligule a ciliate membrane. Leaf-blades flat or conduplicate, 4.5–22 cm long, 1.5–7 mm wide. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, paired or digitate, unilateral, 1.5–7 cm long. Rhachis angular, glabrous on surface or pubescent on surface, glabrous on margins. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, obtuse or subacute, 1.6–2.1 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 2–5 -veined. Upper glume surface puberulous. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, 2–5 -veined, puberulous, acute. Fertile lemma obovate, 1.5–2 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex obtuse, without ornament (or few obscure hairs). Palea involute, indurate.

Flower and Fruit. $2n = 20$ (1 ref TROPICOS).

Axonopus flabelliformis Swallen. *Bull. Torr. Bot. Cl.* 75: 82 (1948).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Guyana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 17275, 30 Dec 1919, Guyana: Half-way station between Wismar and Rockstone on the Demerara River, 6:N, sandy soil, bunches 1–2 ft in diameter (US-1038571).

Recent Synonyms: *Axonopus purpurellus* Swallen, *Bull. Torr. Bot. Cl.* 75: 82 (1948).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (59, Fig. 30), E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (86, Fig. 12).

Derivation (Clifford & Bostock 2007): *L. flabella*, fan; forma, appearance. The crowded equitant basal leaves resemble a fan.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms erect, slender, 50–100 cm long. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaf-sheaths 5–30 cm long. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades conduplicate, 5–35 cm long, 4–16 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 12–15 cm long. Racemes 10–20, digitate, ascending, unilateral, 5–10 cm long. Central inflorescence axis 2.5–4 cm long. Rhachis angular, 0.3–0.4 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6.5–8 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse, 1.3–1.8 mm long, 0.6 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2–5 -veined. Upper glume primary vein absent or distinct.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2–5 -veined, without midvein or with obscure midvein. Fertile lemma 1.3–1.8 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex obtuse or acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. French Guiana, Guyana, Surinam, Venezuela. Brazil North. Amazonas, Acre, Rondonia.

Axonopus furcatus (Fluegge) Hitchcock. *Rhodora* 8: 205 (1906).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from USA. **Basionym or Replaced Name:** *Paspalum furcatum* Fluegge, *Gram. Monog.* 114 (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Bosc s.n.*, USA: Carolinas (?; IT: US).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (567), A.S.Hitchcock, *Manual of the Grasses of the West Indies* (1936) (190, Fig. 121).

Derivation (Clifford & Bostock 2007): *L. furca*, fork; *-atus*, possessing. Inflorescence branches arising in pairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms 20–80 cm long, wiry, 1–5 -noded. Culm-internodes terete or elliptical in section. Culm-nodes glabrous or pubescent. Lateral branches lacking. Leaves cauline. Leaf-sheaths 1–25 cm long, without keel or keeled. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades linear or lanceolate, 3–25 cm long, 2–15 mm wide. Leaf-blade surface glabrous to pilose, densely hairy. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary, with 1–2 peduncles per sheath. Peduncle 10–60 cm long. Racemes 2, paired, spreading, unilateral, 7–10 cm long. Rhachis narrowly winged, flattened, drab, glabrous on surface, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 1.8–6 spikelets per cm. Raceme-bases brief or linear, 0–5 mm long, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acuminate, 3.5–5 mm long, 1.5 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume surface glabrous or pubescent, hairy on veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.3–1.6 length of fertile lemma, 1 length of spikelet, 5–7 -veined, glabrous or pubescent, hairy on veins. Fertile lemma 2.7–3.2 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America, South America.

Country /Province /State. **South-central USA, Southeastern USA.** Texas. Alabama, Florida, Georgia, Louisiana, Mississippi, North Carolina, South Carolina. **Caribbean, Brazil.** Cuba.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *R.M. Harley, S.A. Renvoize, C.M. Erskine, C.A. Brighton & R. Pinheiro 16012*, 5 Feb 1974, Brazil: Bahia: Serra do Sincora, by Rio Cumbuca, ca. 3 km N of Mucugj on Andaraí road, on conglomerate sandstone rock with partly burnt-over vegetation among rocks by river and neighbouring hillside, 41:23'W, 13:00'S, 850 m (CEPEC; IT: K, MO-3426092, U, US-3260298).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (191, Fig. 72).

Derivation (Clifford & Bostock 2007): *L. grandis*, large; folium, leaf. Leaf-blades large.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual or perennial, short-lived. Butt sheaths pubescent. Culms robust, 90–120 cm long. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 15–32 cm long, 7–15 mm wide. Leaf-blade surface glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes. Racemes 7–22, digitate, ascending, unilateral, 12–24 cm long. Central inflorescence axis 4–10 cm long. Rhachis angular, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, subacute, 2–2.2 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma 2 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex acute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.
Bahia. Bahia.

Axonopus herzogii (Hack.) Hitchcock. *Contrib. U. S. Nat. Herb.* 24: 431 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. **Basionym or Replaced Name:** *Paspalum herzogii* Hack., Fedde, *Repert. Nov. Sp.* 7: 50 (1909). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Herzog* 866, May 1905, Bolivia: Santa Cruz: Santiago de Chiquitos: Cerro San Miserate (W; IT: US-2855300 (fragm. ex W)).

Illustrations (Books): S.A.Renvoize, *Gramineas de Bolivia* (1998) (492, Fig. 108).

Derivation (Clifford & Bostock 2007): in honor of Theodor Herzog (1880–1961) German botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms 40–60 cm long, 1–2-noded. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 5–30 cm long. Ligule a ciliate membrane, 0.3 mm long. Leaf-blades curved or tortuous, conduplicate, 11–15 cm long, 2–3 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 15–30 cm long, glabrous. Racemes 2–7, digitate, ascending, unilateral, 5–10 cm long. Central inflorescence axis 1–1.5 cm long, pilose. Rhachis angular, 0.3–0.5 mm wide, glabrous on surface, scabrous on margins, ciliate on margins. Rhachis hairs white, 1–3 mm long. Spikelet packing adaxial, 8–9 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or ovate, dorsally compressed, acute, 2.5 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, mid-green or purple, 5 -veined. Upper glume margins tuberculate, villous. Upper glume hairs 2–3 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, mid-green or purple, 5 -veined, tuberculate on margins, villous on margins, bearing hairs 2–3 mm long. Fertile lemma 2.5 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia.

Axonopus hirsutus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 55 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Bolivia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Santa Cruz: Portachuelo, *Steinbach in Hb. Osten* 14598 (HT: US; IT: IAN, R).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. hairy. Plant hairy in respect to all or some parts.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms 25–40 cm long. Culm-nodes bearded. Ligule a ciliolate membrane. Leaf-blades flat or conduplicate, 3–20 cm long, 2–4 mm wide. Leaf-blade apex obtuse to acute.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Racemes 3–5, digitate, unilateral, 5–8 cm long. Rhachis scabrous on margins. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic to ovate, dorsally compressed, 1.5–2 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 2–4 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, membranous, 2–4 -veined, without midvein. Fertile lemma elliptic, 1.5–2 mm long, indurate, yellow, shiny, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Bolivia.

Axonopus hydrolithicus T.S. Filgueiras, G. Davidse & F.O. Zuloaga) A. López & O. Morrone. *Syst.Bot.* 37 (3): 675 (2012).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Ophiochloa hydrolithica* T.S. Filgueiras, G. Davidse & F.O. Zuloaga, *Novon* 3(4): 360 (1993). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T.S. Filgueiras & R.D. Lopez 2438*, 4 Aug 1992, Brazil: Goiás: Niquelandia Mun.: Macedo, ca. 20 km da cidade, 3,200 to 3,394 mt (SP; IT: CANB, IBGE, ISC, K, L, LE, MO, PRE, RB, SI, UB, UFG, US-3278348).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): Gk. *hydor*, water; *lithos*, stone; L. *-ica*, belonging to. Growing on rocks in a seasonal stream.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect, 45–78 cm long, 7–11 -noded. Culm-internodes thin-walled, distally glabrous. Culm-nodes brown, glabrous. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths wider than blade at the collar, without keel, striately veined, glabrous on surface, outer margin glabrous. Ligule a fringe of hairs, 0.5 mm long. Leaf-blades filiform, terete, 10–20 cm long, 0.5–1 mm wide. Leaf-blade surface grooved along midline, scaberulous, pilose, sparsely hairy.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Peduncle 6–21 cm long. Racemes 1, single, straight or arcuate, unilateral, 6.6–9.2 cm long. Rhachis broadly winged, membranous, folded longitudinally to embrace spikelets, 1.8–2.2 mm wide, glabrous on margins or ciliate on margins, terminating in a barren extension, extension 5 mm long. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 2.3–3.1 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume lanceolate, 2.3–3.1 mm long, 1 length of spikelet, hyaline, without keels, 2 -veined. Upper glume primary vein absent. Upper glume surface scabrous. Upper glume apex erose, acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret unlike other scales, lanceolate, 1.5–2 mm long, 0.66 length of spikelet, hyaline, 2 -veined, without midvein, distinctly veined, ciliate on margins, bearing hairs 1.5 mm long, acute, awned. Awn of lower sterile floret

flexuous, 5–7 mm long. Fertile lemma oblong, dorsally compressed, 1.9–2.2 mm long, membranous, much thinner above, dark brown, without keel. Lemma margins flat. Lemma apex acute. Palea gaping, 1.8–2.2 mm long, 1 length of lemma, hyaline, 2 -veined. Palea apex dentate, 2 -fid.

Flower and Fruit. Lodicules 2, 0.1 mm long. Anthers 2, 1.3–1.7 mm long, purple. Stigmas 2, terminally exerted. Caryopsis with adherent pericarp, obovoid, 1–1.2 mm long. Embryo 0.4–0.5 length of caryopsis. Hilum punctiform or elliptic.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central. Goiás.

Axonopus iridifolius (Poepp.) G. A. Black. *Advanc. Front. Pl. Sci.* 5: 125 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru. **Basionym or Replaced Name:** *Paspalum iridifolium* Poepp., *Reise*, 2: 324. (1836). T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *E.F. Poeppig* 24, 1828, Peru: in collibus sylvaticis ad Cochero (W; IT: LE, US-2855290, US-2855290 (fragm. ex LE)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. folium*, leaf. Leaf-blades rather wide and flat, the plants thereby resembling *Iris* species.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 55–100 cm long. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaves basal and cauline. Leaf-sheaths 5–40 cm long, keeled, pilose. Ligule a ciliolate membrane, 1 mm long. Leaf-blades flat or conduplicate, 6–25 cm long, 2–19 mm wide. Leaf-blade surface scabrous. Leaf-blade apex obtuse, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 30 cm long. Racemes 6–20, digitate or borne along a central axis, ascending, unilateral, 8–18 cm long. Central inflorescence axis 6–15 cm long. Rhachis angular, 0.3 mm wide, dark-coloured (purple), glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, obtuse, 2.1–3 mm long, 0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 5 -veined. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2–1.4 length of fertile lemma, 1 length of spikelet, purple, 4–5 -veined, without midvein or with obscure midvein, pubescent, hairy between veins. Fertile lemma 1.8–2.1 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Bolivia, Colombia, Peru.

Axonopus jeanyae G. Davidse. *Ann. Missouri Bot. Gard.*, 74(2): 421 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Panama. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: *G. Davidse & C.W. Hamilton* 23570, 3 Feb 1983, Panama: Cocli: area between Caqo Blanco del norte, Caqo Sucio and Chorro de Rmo Tife, 8:42'19"-8:43'06"N, 80:36'30"-80:38"W, evergreen forest, 200–400 m, spray basin of waterfall (MO-3475959; IT: ISC, PMA, US-3260346).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jeany Vander Neut Davidse (1945-) United States research assistant at Missouri Botanical Garden.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 50–75 cm long, 2–3 mm diam. Culm-internodes distally glabrous. Culm-nodes swollen, pubescent. Lateral branches sparse. Leaves mostly basal, without demarcation between sheath and blade. Leaf-sheaths outer margin hairy. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades flat or conduplicate, 10–25 cm long, 2–3 mm wide. Leaf-blade margins tuberculate-ciliate, hairy at base. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 2 peduncles per sheath. Racemes 2–5, digitate, unilateral, 4–11 cm long. Central inflorescence axis 2–2.5 cm long. Rhachis angular, 0.3–0.4 mm wide, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 1.9–2.5 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 4–5 -veined. Upper glume primary vein absent or distinct. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 4–5 -veined, without midvein or with evident midvein, pubescent, hairy between veins. Fertile lemma oblong, 1.8–2.1 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1–1.1 mm long. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Panama.

Axonopus jesuiticus (Araujo) Valls. *Fl. Fan. Est. Sao Paulo* 1:136 (2001).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Axonopus compressus* var. *jesuiticus* Araujo, *Bol. Secr. Agr. Ind. Com.* 100:36 (1943).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-icum*, belonging to. In honor of the Jesuit Order.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, mat forming. Stolons present. Culms decumbent, 20–40 cm long. Leaf-sheaths glabrous on surface. Ligule a ciliate membrane, 0.2–0.3 mm long. Leaf-blades linear, conduplicate, 7–29 cm long, 0.5–6 mm wide. Leaf-blade surface glabrous. Leaf-blade margins glabrous or ciliate, hairy at base. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes, terminal and axillary. Racemes (2–)3–5(–6), digitate, erect, unilateral, 5–9.5 cm long. Rhachis angular, glabrous on surface, glabrous on margins. Spikelet packing adaxial, regular, 2 -rowed. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, 1.9–2 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1.1–1.2 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 2(–4) -veined. Upper glume primary vein absent. Upper glume lateral veins obscure. Upper glume surface glabrous. Upper glume apex acute.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1.1–1.2 length of fertile lemma, 1 length of spikelet, 2(–4) -veined, without

midvein, glabrous, acute. Fertile lemma elliptic, 1.6–1.8 mm long, indurate, yellow, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, red.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.
Sao Paulo.

Axonopus junciformis G. A. Black. *Advanc. Front. Pl. Sci.* 5: 48 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Chase 11868, 7 Apr 1930, Brazil: Matto Grosso: W of Santa Rita do Araguaia (Goiás), ca. 10 km s of Santa Rita, sandy campo, summit leaning, colony (US-1501338).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. junceus*, rush-like; forma, shape. In habit resembling certain *Juncus* species.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 120 cm long, wiry, 2–3 -noded. Leaves basal and cauline. Leaf-sheaths 7–15 cm long, without keel. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades involute, 10–50 cm long, 1–2 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 30–40 cm long. Racemes 2–4, digitate, erect or ascending, flexuous, unilateral, 10–25 cm long. Central inflorescence axis 3–6 cm long. Rhachis angular, 0.6–0.7 mm wide, glabrous on surface, smooth on margins or scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, obtuse, 3.2 mm long, 1.4 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, 4 -veined. Upper glume primary vein absent. Upper glume surface puberulous. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, 4 -veined, without midvein, puberulous, acute. Fertile lemma 3.2 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.
Mato Grosso. Mato Grosso.

Axonopus kleinii L.B. Smith & D.C. Wasshausen. *Bradea* 2(35): 244 (1978).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: L.B. Smith & R. Klein 7432, 8 Nov 1956, Brazil: Santa Catarina: Mun. Campo Alegre, Morro Iquererim, alt. 1300–1500 m (US-2237569).

Illustrations (Books): L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1102, Fig. 217).

Derivation (Clifford & Bostock 2007): in honor of Roberto Miguel Klein (1923–1992) Brazilian botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Culms erect, 23–43 cm long. Leaves mostly basal. Leaf-sheaths 4 cm long, without keel, glabrous on surface or pilose, outer margin

hairy. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blades erect, conduplicate, 10 cm long, 2.5 mm wide, stiff. Leaf-blade surface glabrous or pilose, sparsely hairy. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Racemes 3–4, digitate, erect, flexuous, unilateral, 3–5 cm long. Central inflorescence axis 1–2 cm long. Rhachis angular, 0.5–0.7 mm wide, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 1–1.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate, dorsally compressed, acute, 4 mm long, 1.5 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume surface pilose. Upper glume hairs white.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, pilose, bearing white hairs. Fertile lemma 4 mm long, indurate, pallid, shiny, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil South.

Catarina, Rio Grande do Sul. Santa Catarina.

Axonopus kuhlmannii G. A. Black. *Advanc. Front. Pl. Sci.* 5: 156 (1963).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.G. Kuhlmann 1730*, Jan 1919, Brazil: Mato Grosso: Campo dos Urupas (IAN-62429: IT: US-2236060 (fragm. ex IAN & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Kuhlmann (fl. 1918) who collected in Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons present. Culms erect, 50–100 cm long, 7–8 -noded. Culm-nodes glabrous or pubescent. Lateral branches ample. Leaf-sheaths 2–10 cm long, narrower than blade at the collar, glabrous on surface or pubescent. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blades 15–40 cm long, 1.5–3 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface scabrous, glabrous. Leaf-blade apex attenuate, simple or filiform.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–2 peduncles per sheath. Peduncle 15–30 cm long. Racemes 3–10, digitate, spreading, flexuous, unilateral, 5–12 cm long. Central inflorescence axis 1.5–3 cm long. Rhachis angular, 0.6–0.7 mm wide, glabrous on surface, smooth on margins or scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 7–11 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acute, 2 mm long, 0.5–0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 3–5 -veined. Upper glume primary vein absent or distinct. Upper glume margins ciliate. Upper glume hairs 0.5–1 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.3 length of fertile lemma, 1 length of spikelet, 3–5 -veined, without midvein or with obscure midvein. Fertile lemma 1.5 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central.

Mato Grosso.

Axonopus laxiflorus (Trin.) Chase. *Proc. Biol. Soc. Wash.* 24: 133 1911.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum laxiflorum* Trin., *Mem. Acad. Petersb. Ser.* 6 (3) 2 : 148. (1835). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.H. von Langsdorff s.n.*, Nov. 1824, Brazil: Minas Gerais: Serra da Lapa: in saxosis pratisque humidis (LE-TRIN-0481.01; IT: US-80071).

Recent Synonyms: *Axonopus schultesii* G. A. Black, *Advanc. Front. Pl. Sci.* 123 (1963).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. laxus*, loose; flos, flower. Inflorescence an open panicle.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Cataphylls evident. Rhizomes elongated. Culms robust, 70–100 cm long, 1–2 -noded. Culm-nodes pubescent or bearded. Leaves mostly basal, without demarcation between sheath and blade. Leaf-sheaths 6–40 cm long, keeled, pubescent, outer margin hairy. Ligule a ciliate membrane, 0.3–0.4 mm long. Leaf-blades persistent or deciduous at the ligule, 40–80 cm long, 4–6 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex obtuse, asymmetrical.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 10–50 cm long. Racemes 10–20, borne along a central axis, ascending or spreading, unilateral, 5–20 cm long. Central inflorescence axis 6–10 cm long. Rhachis angular, 0.3 mm wide, with scattered hairs or glabrous on surface, smooth on margins or scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4–5.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–1 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse, 2.8–3.3 mm long, 1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume lateral veins prominent. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 5–7 -veined, prominently veined, glabrous or puberulous, hairy between veins. Fertile lemma 2.6–2.9 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil. Colombia. Brazil Southeast. Minas Gerais.

Axonopus laxus Luces. *Bol. Soc. Venez. Cienc. Nat.* 15: 20 (1953).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Z. Luces* 299, 25 Sep 1947, Venezuela: Aragua: Maracay, sabanas del valle de Limsn (VEN; IT: US-2236522 (photo ex VEN)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. loose*. Inflorescence much branched either as a single panicle or from branching of the culms.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms geniculately ascending, slender, 30–50 cm long, 4 -noded. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaf-sheaths 7.5 cm long, narrower than blade at the collar, hirsute, with tubercle-based hairs, outer margin glabrous. Ligule a

ciliolate membrane, 0.3 mm long. Leaf-blades 10–21 cm long, 5–9 mm wide. Leaf-blade surface hirsute, hairy on both sides, with tubercle-based hairs. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–2 peduncles per sheath. Peduncle 7–14 cm long. Racemes 2–3, paired or digitate, spreading, flexuous, unilateral, 5–6 cm long. Rhachis angular, 0.4 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 7 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acute, 1.5–1.7 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, pallid, 4 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, pallid, 4 -veined, without midvein, pubescent, hairy between veins. Fertile lemma 1.5–1.7 mm long, indurate, pallid, shiny, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus leptostachyus (Fluegge) Hitchcock. *Contrib. U. S. Nat. Herb.* 22: 471 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Paspalum leptostachyum* Fluegge, *Gram. Monog.* 123. (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: F.W.H.A. von Humboldt & A.J.A. Bonpland *s.n.*, no date, Venezuela (B-W; IT: US-80079 (fragm. ex B-W)).

Recent Synonyms: *Axonopus paranaensis* L. Parodi, *Rev. Arg. Agron.* 28:111 (1962).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (266), S.A.Renouvoise, *Gramineas de Bolivia* (1998) (497, Fig. 109), J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (61, Fig. 34), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (49, Fig. 11 & as *A. paranaensis*).

Derivation (Clifford & Bostock 2007): Gk. *leptos*, narrow; *stachys*, ear of corn. Spikelets long and narrow.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms robust, 50–150 cm long, 2–5 -noded. Culm-internodes terete or elliptical in section. Culm-nodes swollen, glabrous or pubescent. Lateral branches lacking. Leaves cauline, without demarcation between sheath and blade. Leaf-sheaths 10–30 cm long, longer than adjacent culm internode, keeled, glabrous on surface. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades conduplicate, 1–50 cm long, 3–5 mm wide, stiff. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–75 cm long. Racemes 5–15, digitate, spreading, unilateral, 5–25 cm long. Central inflorescence axis 3–15 cm long. Rhachis angular, 0.3–0.5 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5–11 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acute, 2.3–2.5 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume primary vein absent or obscure. Upper glume surface glabrous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2–1.4 length of fertile lemma, 1 length of spikelet, 5–7 -veined, without midvein or with evident midvein, glabrous. Fertile lemma 1.6–2 mm long, indurate, light brown, shiny, without keel. Lemma margins involute. Lemma apex without ornament or pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Axonopus longispicus (Doell) Kuhl. *Comm. Linh. Telegr. Matto Grosso, Amaz. Anexo 5, Bot.* 11: 87 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum longispicum* Doell, *Mart. Fl. Bras.* 2 (2) 105. (1877). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *Spruce (Paspalum 33) 1382*, Jan 1851, Brazil: Amazonas: Manaus, among wet rocks (K; IT: BR, FREI, GH, M, P, US-2855821 (fragm. ex B, FR, M, P-Pittier & Durandt hb.), US-1127316 (fragm. ex W), W).

Illustrations (Books): E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (86, Fig. 12).

Derivation (Clifford & Bostock 2007): *L. longus*, long; spica, thorn. With long spikelets or inflorescence branches.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 30–60 cm long, 1–3 -noded. Culm-nodes glabrous. Leaf-sheaths 3–10 cm long, wider than blade at the collar. Ligule a ciliolate membrane, 0.3–0.7 mm long. Leaf-blades spreading, 10–20 cm long, 4–10 mm wide. Leaf-blade midrib conspicuous. Leaf-blade surface pubescent, sparsely hairy. Leaf-blade apex obtuse or abruptly acute.

Inflorescence. Inflorescence composed of racemes, with 1–4 peduncles per sheath. Peduncle 25 cm long. Racemes 2–3, paired or digitate, erect or ascending, unilateral, 5–15 cm long. Central inflorescence axis 0–3 cm long. Rhachis angular, 0.3 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4.5–6 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.2–0.3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse or subacute, 3–3.9 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins obscure. Upper glume surface pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 2 length of fertile lemma, 1 length of spikelet, 5 -veined, obscurely veined, pubescent. Fertile lemma 1.6–2 mm long, indurate, light brown, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Northern South America, Brazil. French Guiana, Guyana, Venezuela. Colombia. Brazil North.

Axonopus magallanisiae D.Giraldo-Canas. *Caldasia* 22(2): 237 (2000).

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Bolívar: Distrito Cedeño: meseta de Jaua, sector centro-merdional, bosques ribereños, arbustales y herbazales tepeyanos ubicados en altiplanicie meridional, cabeceras del río Marajano, afluente del río Cácaro, 4°8'N, 64°2' O, 1750–1800 m, 20 Nov 1989, *O. Huber 12995*, HT: COL; IT: MO, MYF, SI, VEN.

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Aurim Megallanes Nessi, Venezuelan botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Rhizomes short. Basal innovations flabellate. Culms erect, 25–50 cm long, 1–2 -noded. Culm-internodes 3–5 cm long, striate, distally glabrous. Culm-nodes brown, bearded. Lateral branches lacking. Leaf-sheaths 0.6–11.5 cm long, keeled, outer margin glabrous or hairy. Ligule a ciliate membrane, 0.25 mm long. Leaf-blades 3–10 cm long, 2–7 mm wide. Leaf-blade margins tuberculate-ciliate, hairy at base.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 24–30 cm long, glabrous. Racemes 3–5, digitate, unilateral, 4–8 cm long. Central inflorescence axis 0.8–1.4 cm long. Rhachis angular, with scattered hairs, scaberulous on margins. Spikelet packing adaxial, regular, 2 -rowed. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2.2–2.5 mm long, 0.8–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 4–5 -veined. Upper glume primary vein absent or obscure. Upper glume lateral veins distinct.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, 4–5 -veined. Fertile lemma elliptic, 2.2–2.5 mm long, indurate, dark brown, shiny, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Lodicules 2, 0.4 mm long. Anthers 3, 0.6–0.8 mm long.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus maguirei G. Black. Mem. N. Y. Bot. Gard. 9: 252 (1957).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Maguire & C.K. Maguire 40108*, 29 Nov 1954, Brazil: Rio Branco: Serra Tepequem, coarse bunch grass, occasional in valley woodland south of airstrip, elev. 700 m (US-2182169).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Basset Maguire (1904–1991) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths pubescent. Culms erect, 160 cm long, 5 mm diam., 8 -noded. Culm-internodes elliptical in section, yellow. Culm-nodes pubescent. Leaf-sheaths 3–30 cm long, keeled, pubescent. Ligule a ciliate membrane, 0.4–0.5 mm long. Leaf-blades lanceolate, 7–40 cm long, 15–20 mm wide. Leaf-blade surface pilose, densely hairy, hairy on both sides. Leaf-blade margins scabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–2 peduncles per sheath. Peduncle 15–45 cm long. Racemes 10–14, borne along a central axis, ascending, unilateral, 8–15 cm long. Central inflorescence axis 5–10 cm long. Rhachis angular, 0.6–0.8 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse, 2–2.4 mm long, 0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 5–7 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, purple, 5–7 -veined, pubescent, hairy between veins. Fertile lemma 2.1–2.2 mm long, indurate, light brown, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. Guyana, Venezuela. Brazil North. Roraima. Amazonas, Roraima.

Axonopus marginatus (Trin.) Chase ex Hitchcock. *Contrib. US. Nat. Herb.* 17: 226 (1913).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum marginatum* Trin., *Gram. Panic.* 90. (1826). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.H. von Langsdorff*, Nov. 1824, Brazil: Minas Gerais: S[erra] da Lapa: in pratis siccis glareosis (LE-TRIN-0490.01 (& fig.); IT: US-2855812 (fragm. ex LE-TRIN)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (267), S.A.Renvoize, *Gramineas de Bolivia* (1998) (199, Fig. 110), S.A.Renvoize, *The Grasses of Bahia*, 1984 (196, Fig. 74), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (47, Fig. 10).

Derivation (Clifford & Bostock 2007): *L. margo*, border; -ata, possessing. Leaf-blades or lemma with hairs in their margins or the margins otherwise conspicuous.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes absent or short. Stolons present. Butt sheaths withering or persistent and investing base of culm, with fibrous dead sheaths. Culms 30–85 cm long, 1–3 -noded. Culm-nodes pubescent or bearded. Leaves mostly basal. Leaf-sheaths 3–13 cm long, as wide as blade at the collar, glabrous on surface. Leaf-sheath oral hairs ciliate. Ligule a ciliate membrane, 0.5 mm long. Leaf-blades flat or conduplicate, 4–30 cm long, 2–4 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, without bracts or bracteate at branch bases (lowest raceme), with 1–2 peduncles per sheath. Peduncle 10–25 cm long. Racemes 2–13, digitate, ascending, unilateral, 4–15 cm long. Central inflorescence axis 2–4 cm long. Rhachis angular, 0.5–0.7 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 3–5.5 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.1–0.3 mm long, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic to ovate, dorsally compressed, acute, 2.5–3 mm long, 0.7–0.8 mm wide, with hairs extending 0.5–1 mm beyond apex, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2–4 -veined. Upper glume primary vein absent. Upper glume surface pilose, hairy between veins. Upper glume hairs white or purple, 0.5–1 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2–4 -veined, without midvein, pilose, hairy between veins, bearing white hairs or purple hairs, bearing hairs 0.5–1 mm long. Fertile lemma 2.5–3 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex without ornament or pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America, Brazil, Southern South America. Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast. Argentina Northeast, Paraguay.

Mato Grosso, Goias, Bahia, Maranhao, Piaui, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana. Distrito Federal, Mato Grosso, Goiás. Bahia, Maranhão, Pernambuco. Minas Gerais, Sao Paulo. Paraná. Misiones.

Axonopus mathewsii (Mez) Hitchcock. *Contrib. U. S. Nat. Herb.* 24: 432 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Peru, Ecuador. **Basionym or Replaced Name:** *Paspalum mathewsii* Mez, Fedde, *Repert* 15: 62 (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: ST: *W. Mathews* 3239, no date, Peru (B, GH, K, US-80091 (fragm. ex B, G)).

ST: *Andre* 4322, Ecuador: in jugo centrali Andinum, alt. 2200 m.

Illustrations (Journals): *Ruizia* (13:384 Fig 51c-d (1993)).

Derivation (Clifford & Bostock 2007): in honor of Andrew Mathews (- 1841) who collected in Peru.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect or geniculately ascending, 35–50 cm long, 1–2 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Leaf-sheaths 6–15 cm long, outer margin hairy. Ligule a ciliolate membrane, 0.4–0.7 mm long. Leaf-blades 7–15 cm long, 5–10 mm wide. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 10–30 cm long. Racemes 2–8, digitate, spreading or deflexed, unilateral, 4–10 cm long. Central inflorescence axis 4–5 cm long. Rhachis angular, 0.3–0.4 mm wide, dark-coloured (purple), glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.6–0.9 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acuminate, 2.5–2.6 mm long, 0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 4–5 -veined. Upper glume lateral veins absent or distinct. Upper glume surface glabrous.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2 length of fertile lemma, 1 length of spikelet, 4 -veined, without midvein, glabrous. Fertile lemma 2.2–2.3 mm long, indurate, light brown, without keel. Lemma margins involute. Lemma apex acute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Ecuador, Peru.

Axonopus mexicanus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 144 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Mexico: Sinaloa: About 47 miles east of Villa Union (1 mile east of Santa Lucia) on the road from Villa Union to Durango, growing in scattered clumps, not common, alt. 1280 m, 27 Sep 1953, *J.R. Reeder & C.G. Reeder* 2445 (HT: IAN).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ana*, indicating origin. From Mexico.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms 60 cm long, 1 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 6–10 cm long, longer than adjacent culm internode. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades 15–25 cm long, 10–15 mm wide. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 25 cm long. Racemes 14, digitate, ascending, unilateral, 10–14 cm long. Central inflorescence axis 9 cm long. Rhachis angular, 0.3 mm wide, glabrous on surface, smooth on margins or scaberulous on margins, glabrous on

margins. Spikelet packing adaxial, 5.6 spikelets per cm. Raceme-bases brief, glabrous or pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2–2.1 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, hyaline, pallid, 2–3 -veined. Upper glume primary vein absent or obscure. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, 2–3 -veined, without midvein or with obscure midvein, acute. Fertile lemma 2–2.1 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Northwest Mexico. Durango. Sinaloa.

Axonopus micay Garc.-Barr. *Caldasia* 8: 432 (1960).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: W.A. Archer 99, 11 Jun 1930, Colombia: Antioquia: Medellin, alt. ca. 1500 m, "Yerba micay," forms loose prostrate stolls and roots from the nodes (COL-1919; IT: MO-3326811 (fragm.), US-1541930).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): vernacular name for the species in Colombia.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Stolons present. Culms erect or decumbent, 75–150 cm long, 4–8 mm diam., without nodal roots or rooting from lower nodes. Culm-internodes distally glabrous. Culm-nodes glabrous. Lateral branches sparse. Leaves cauline. Leaf-sheaths glabrous on surface or pubescent, outer margin glabrous or hairy. Ligule a ciliolate membrane, 0.5–0.9 mm long. Collar glabrous or pubescent. Leaf-blades 15–38 cm long, 12–18 mm wide. Leaf-blade surface glabrous to pubescent, sparsely hairy, hairy adaxially. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal and axillary, with 1–2 peduncles per sheath. Racemes 3–24, digitate or borne along a central axis, ascending, unilateral, 6–16 cm long, simple or with branchlets at base of longer racemes. Central inflorescence axis 4–5 cm long. Rhachis angular, 0.4–0.7 mm wide, with scattered hairs or glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 2.2–2.8 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 4 -veined. Upper glume primary vein absent. Upper glume margins pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 4 -veined, without midvein, pubescent on margins. Fertile lemma oblong, 2.2–2.8 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1–1.5 mm long. Caryopsis with adherent pericarp.

$2n = 40$ (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica, Northern South America, Western South America. Costa Rica, El Salvador, Panama. Venezuela. Colombia, Ecuador.

Axonopus monticola G. A. Black. *Advanc. Front. Pl. Sci.* 5: 107 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Chase 9859, 20–22 May 1925, Brazil: Sao Paulo: campos do Jordco, serra Mantiqueira, moist campo, alt. 1600 m (US-1257120).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. mons*, mountain; *-cola*, dweller. Growing on mountains.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated. Culms erect, robust, 100–150 cm long, 2–3-noded. Culm-internodes elliptical in section. Culm-nodes glabrous or pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 10–40 cm long, outer margin glabrous or hairy. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades conduplicate, 15–40 cm long, 6–8 mm wide, stiff. Leaf-blade surface smooth. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 20–50 cm long. Racemes 15–20, borne along a central axis, ascending, unilateral, 5–25 cm long, simple or with branchlets at base of longer racemes. Central inflorescence axis 10–15 cm long. Rhachis angular, 0.3–0.4 mm wide, drab or dark-coloured (purple), glabrous on surface, scabrous on margins, glabrous on margins or ciliate on margins. Rhachis hairs 0.3–0.8 mm long. Spikelet packing adaxial, 3.5–6 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–0.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse or subacute, 1.7–2.3 mm long, 0.6–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 4–5 -veined. Upper glume primary vein absent or obscure. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, purple, 4–5 -veined, with obscure midvein, puberulous, hairy between veins. Fertile lemma 1.7–2.3 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast.

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia: Guaviare: Mun. San Josi del Guaviare, inspeccin de La Fuga, sabanas naturales de La Fuga, 200 m, Mar 1996, D. Giraldo-Caças & R. Lspez 2624 (HT: COAH; IT: COL, HUA, MO, SI).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Osvaldo Morrone (fl. 1993) Argentinian botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations flabellate. Culms slender, 6–20 cm long. Culm-internodes 2–3.8 cm long. Culm-nodes black, glabrous. Lateral branches lacking. Leaf-sheaths 1–4.4 cm long, keeled, glabrous on surface, outer margin hairy. Ligule a ciliate membrane, 0.1–0.3 mm long. Leaf-blades lanceolate, flat or conduplicate, 1.2–5.8 cm long, 3–6 mm wide. Leaf-blade surface scaberulous, pilose. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 2.4–11.7 cm long, glabrous. Racemes 3, digitate, ascending, unilateral, 2–3.5 cm long. Central inflorescence axis 0.4–0.9 cm long. Rhachis angular, with scattered hairs, scaberulous on margins. Spikelet packing adaxial, regular, 2-rowed. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, 1.2–1.4 mm long, 0.5–0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of adjacent fertile lemma, 1 length of spikelet, membranous, without keels, 0–2 -veined. Upper glume primary vein absent. Upper glume lateral veins absent or obscure.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1 length of fertile lemma, 1 length of spikelet, 0–2 -veined, without midvein, without lateral veins or obscurely veined. Fertile lemma elliptic, 1.2–1.4 mm long, indurate, yellow, shiny, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Lodicules 2, 0.3 mm long. Anthers 3, 1–1.2 mm long, purple.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.

Axonopus multipes Swallen. *Journ. Wash. Acad. Sc.* 23: 459 (1933).

TYPE from Mexico. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A.S. Hitchcock 6578, 31 Aug 1910, Mexico: Veracruz: sandy prairie, at sea level (US-928824).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. multus*, many; *pes*, foot.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms geniculately ascending or decumbent, 10–15 cm long, 1-noded. Culm-nodes glabrous. Leaf-sheaths 2–8 cm long, glabrous on surface. Ligule a ciliate membrane, 0.3–0.4 mm long. Leaf-blades 3–6 cm long, 4–7 mm wide. Leaf-blade surface glabrous. Leaf-blade margins ciliate, hairy at base. Leaf-blade apex obtuse, soon splitting.

Inflorescence. Inflorescence composed of racemes, with 3–4 peduncles per sheath. Peduncle 6–8 cm long. Racemes 2, paired, erect or ascending, unilateral, 4–6 cm long. Central inflorescence axis 0 cm long. Rhachis angular, 0.6–0.7 mm wide, drab or dark-coloured (purple), glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 4–6 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse to acute, 2.8–3 mm long, 1–1.4 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, mid-green or purple, 5–7 -veined. Upper glume margins eciliate or pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.4 length of fertile lemma, 1 length of spikelet, mid-green or purple, 5–7 -veined, eciliate on margins or pubescent on margins. Fertile lemma 2–2.1 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. North America.

Country /Province /State. Mexico. Gulf (Mexico).

Veracruz.

Axonopus obtusifolius (Raddi) Chase. *Journ. Wash. Acad. Sc.* 1923, 13: 171 (1823).

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Oiapoque, Amapa, Brazil.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual. Culms 50 cm long, 1 -noded. Culm-nodes bearded. Lateral branches lacking. Leaf-sheaths 5–8 cm long, keeled, papillose. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.2–0.3 mm long. Leaf-blades 5–10 cm long, 2–4 mm wide. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 2–7 peduncles per sheath. Peduncle 10–20 cm long. Racemes 2, paired, ascending, unilateral, 1–2.5 cm long. Central inflorescence axis 0 cm long. Rhachis angular, 0.2 mm wide, drab, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 3–4 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or elliptic, dorsally compressed, acuminate, 2.1 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 4–5 -veined. Upper glume primary vein absent or obscure. Upper glume lateral veins obscure or distinct. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 4–5 -veined, without midvein or with obscure midvein, obscurely veined or distinctly veined, pubescent, hairy on veins. Fertile lemma 1.8–1.9 mm long, indurate, grey, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Southeast, Brazil North. Amapa. Sao Paulo.

Axonopus paschalis (Stapf) Pilger. *Nat. Hist. Juan Fernandez & Easter Island* 2: 63 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006), W.D.Clayton & N.Snow, *Key to Pacific Grasses* (2010).

TYPE from Easter Island. **Basionym or Replaced Name:** *Paspalum paschale* Stapf, *Kew Bull.* 1913, 117. (1913). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F. Fuentes* 25, Apr 1911, Chile: Easter Island: common in hill of middle Island (K; IT: US-2942546 (fragm. ex K)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pascha*, Passover; *-alis*, pertaining. From Easter Island.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–80(–100) cm long. Ligule a ciliolate membrane, 0.3–0.7 mm long. Leaf-blades flat or conduplicate, 15–30 cm long, 0.5–0.8 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 3–6, digitate, unilateral, 7–14 cm long. Rhachis angular, glabrous on surface, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 2.5–3 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet. Fertile lemma elliptic, 2.5–3 mm long, indurate, without keel. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Anthers 3. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. Pacific.

Country /Province /State. South-central Pacific. Easter Is.

Axonopus passourae G. A. Black. *Advanc. Front. Pl. Sci.* 5 :117 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from French Guiana. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *G.A. Black & R. Klein* 54–17090, 21 Oct 1954, French Guiana: Campo de Passoura, robusto, em brejo (IAN; IT: CAY, MO-2369280 (fragm. ex CAY), US-2303299).

Illustrations (Books): E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (104, Fig. 14).

Derivation (Clifford & Bostock 2007): from Campo de Passoura, near Kouran, French Guiana.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, robust, 120 cm long, 2–5 -noded. Culm-internodes elliptical in section. Culm-nodes pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 20–40 cm long, keeled, pilose. Ligule a ciliate membrane, 0.7 mm long. Leaf-blades flat or conduplicate, 10–40 cm long, 5–7 mm wide, stiff. Leaf-blade surface glabrous, hairless except near base.

Inflorescence. Inflorescence composed of racemes, with 3 peduncles per sheath. Peduncle 45–50 cm long. Racemes 7–9, digitate, erect or ascending, unilateral, 10–20 cm long. Central inflorescence axis 4–5 cm long. Rhachis angular, 0.5 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present, reduced to a stump, ciliate, hairy at base, with 1–3 mm long hairs.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 1.8–2 mm long, 0.8–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume primary vein obscure or distinct.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5–7 -veined, with obscure midvein or with evident midvein. Fertile lemma 1.8–2 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. French Guiana.

Axonopus paucisetosus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 170 (1963).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.R. Swallen 4053*, 20–25 Mar 1934, Brazil: Maranhco: Carolina to Santo Antonio de Balsas, among rocks, top of rocky hill (US-1613825).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. paucus*, few; *seta*, bristle; *-osa*, abundance. Rhachis with fewer hairs than related species.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 80 cm long, 3–4 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 5–25 cm long. Ligule a ciliate membrane, 0.3 mm long. Leaf-blades flat or conduplicate, 10–20 cm long, 2–3 mm wide, stiff. Leaf-blade surface glabrous. Leaf-blade apex acuminate, filiform.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 25–40 cm long. Racemes 2–4, paired or digitate, ascending, unilateral, 6–13 cm long. Central inflorescence axis 0–2 cm long. Rhachis angular, 0.6–0.7 mm wide, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 9–10 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present, reduced to a stump, ciliate, hairy at base, with 1–2 mm long hairs.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, compressed slightly, obtuse, 1.6–1.7 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, shorter than spikelet, thinner than fertile lemma. Upper glume 0.8–0.9 length of spikelet, membranous, 2–4 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 0.8–0.9 length of fertile lemma, 1 length of spikelet, 2–4 -veined, without midvein, pubescent, hairy between veins. Fertile lemma 1.6–1.7 mm long, indurate, dark brown, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.
Country /Province /State. Brazil. Brazil Northeast.
Maranhao, Piaui. Maranhão.

Axonopus pellitus (Nees ex Trin.) Hitchcock & Chase. *Contrib. US. Nat. Herb.* 18: 301 (1917).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Link.

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (196, Fig. 74).

Derivation (Clifford & Bostock 2007): L. covered with skins. The fertile floret(s) is protected by hairy investing glumes or sterile florets.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths persistent and investing base of culm, with curly dead sheaths. Culms robust, 200 cm long, 2–7 -noded. Culm-nodes pubescent. Leaf-sheaths 10–60 cm long, without keel, hirsute. Leaf-sheath oral hairs lacking or ciliate. Ligule a ciliolate membrane, 0.3–1 mm long. Leaf-blades conduplicate, 10–75 cm long, 3–5 mm wide. Leaf-blade surface hirsute, densely hairy.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–75 cm long. Racemes numerous, 25–50, borne along a central axis, ascending, unilateral, 9–18 cm long. Central inflorescence axis 7–18 cm long. Rhachis angular, 0.3–0.5 mm wide, drab or dark-coloured (purple), glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5–9 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.2–0.5 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 1.5–2.5 mm long, 0.5–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1–1.2 length of fertile lemma, 1 length of spikelet, 5 -veined, pubescent, hairy between veins. Fertile lemma 1.5–2 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F.W. Pennell 1539*, 26–31 Aug 1917, Colombia: Meta: Villavicencio, sandy open hillside, near Rmo Guatiquia, alt. 700–900 m, herb (US-1041805).

Recent Synonyms: *Axonopus hoehnei* G.A. Black, *Advancing Frontiers of Plant Sciences* 5: 143, t. 9 (1963).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Francis Whittier Pennell (1886–1952) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 75 cm long. Culm-nodes pubescent. Leaves mostly basal. Leaf-sheaths 5–25 cm long. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades flat or conduplicate, 10–25 cm long, 5–10 mm wide. Leaf-blade surface scaberulous, rough adaxially, hirsute. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 2 peduncles per sheath. Peduncle 6 cm long. Racemes 18, digitate, ascending, unilateral, 9–14 cm long. Central inflorescence axis 3.5 cm long. Rhachis angular, 0.4–0.5 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6.5 spikelets per cm. Raceme-bases brief, pubescent or pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acute, 1.6–1.7 mm long, 0.5–0.6 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy on veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein, pubescent, hairy on veins. Fertile lemma 1.6–1.7 mm long, indurate, light brown, shiny, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Venezuela. Colombia.

Axonopus perlongus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 89 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online.

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: A. Chase 10730, 4–5 Feb 1930, Brazil: Mato Grosso: Tres Lagoas, conspicuously gray, erect, sandy clay cerrado aberto, 300–325 m (US-1501001).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *per*, very; *longa*, long. Panicle on a long stalk.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 120 cm long, 3–5 -noded. Culm-nodes pubescent. Leaf-sheaths 25–50 cm long, without keel. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.7 mm long. Leaf-blades involute, 25–50 cm long, 1–1.5 mm wide. Leaf-blade surface pilose, hairy adaxially. Leaf-blade apex attenuate, filiform.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 70 cm long. Racemes numerous, 30, borne along a central axis, ascending, unilateral, 20–30 cm long. Central inflorescence axis 15–25 cm long. Rhachis angular, 0.4–0.5 mm wide, drab, glabrous on surface, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 5 spikelets per cm. Raceme-bases brief. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.3–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic, dorsally compressed, acuminate, 2.9–3 mm long, 0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume surface puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.4 length of fertile lemma, 1 length of spikelet, 5–7 -veined. Fertile lemma 2.1–2.2 mm

long, indurate, pallid, without keel. Lemma margins involute. Lemma apex acute, pubescent (few hairs). Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Southeast. Mato Grosso. Mato Grosso. Sao Paulo.

Axonopus piccae Giraldo-Caças. *Caldasia* 21(2): 133, f. 1–3. 1999.

Accepted by: W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia: Guainma: Laja with Indian clearing opposite junction of Rmo Negro, Brazo Casiquiare and Rmo Guanma, weedy area on laja, 65 m, 25 Jun 1984, *G. Davidse & J. Miller 26620* (HT: COL; IT: MO, VEN).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): In honor of Pablo Picca (fl. 1999) Argentinian naturalist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Butt sheaths pubescent. Basal innovations flabellate. Culms robust, 70–110 cm long, 1–2 -noded. Culm-internodes 18–30 cm long, distally glabrous. Culm-nodes pubescent. Leaf-sheaths 10–33 cm long, glabrous on surface. Ligule a ciliate membrane, 1 mm long. Leaf-blades linear or lanceolate, 0.5–47 cm long, 4–20 mm wide. Leaf-blade surface glabrous. Leaf-blade margins scaberulous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1–3 peduncles per sheath. Peduncle 40–70 cm long, scaberulous above, glabrous. Racemes 8–24, digitate, unilateral, 7–27 cm long. Central inflorescence axis 7–15 cm long. Rhachis angular, scaberulous on margins. Spikelet packing adaxial. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present, oblong or reduced to a stump, 0–2.5 mm long, scaberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, 2.2–2.9 mm long, 0.8–1 mm wide, falling entire. Floret callus glabrous or pubescent.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 53 -veined. Upper glume lateral veins prominent. Upper glume surface pubescent. Upper glume margins scaberulous (above).

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1.1 length of fertile lemma, 1 length of spikelet, 5 -veined, pubescent. Fertile lemma elliptic, 1.9–2.4 mm long, 0.7–0.9 mm wide, indurate, yellow, shiny, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Lodicules 2, 0.3 mm long. Anthers 3, 0.7–1 mm long, purple. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America. Venezuela. Colombia.

TYPE from Guatemala. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *O.F. Cook & C.B. Doyle 58*, Apr 1904, Guatemala: Alta Verapaz: in the vicinity of Secanquin, alt. 250–600 m (US-860024).

Recent Synonyms: *Axonopus lineatus* G. A. Black, *Advanc. Front. Pl. Sci.* 5: 67 (1963).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (81, Fig. 22).

Derivation (Clifford & Bostock 2007): Gk. *poa*, grass; *phyllon*, leaf. Apices of leaf-blades boat-shaped as in *Poa*.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short, knotty. Culms erect, 25–100 cm long, 2–3 mm diam., 1–3 -noded. Culm-internodes thin-walled. Culm-nodes pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths mostly shorter than adjacent culm internode, keeled, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long. Leaf-blades flat or conduplicate, 13–33 cm long, 2–5 mm wide.

Inflorescence. Inflorescence composed of racemes. Peduncle 6–25 cm long. Racemes 3–7, digitate, unilateral, 5–11 cm long. Central inflorescence axis 1–4 cm long. Rhachis angular, 0.5 mm wide, with scattered hairs, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 2.5–2.8 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure or two, reaching apex of florets, thinner than fertile lemma. Lower glume lanceolate, 1–2.5 mm long, 1–5 -veined. Upper glume ovate, 1 length of spikelet, membranous, without keels, 2 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy at base. Upper glume margins pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 2 -veined, without midvein, pubescent, hairy at base, pubescent on margins. Fertile lemma ovate, 2.2–2.5 mm long, indurate, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.5–1.8 mm long, purple. Caryopsis with adherent pericarp.

Recent Synonyms: *Axonopus gracilis* G. Black, *Mem. New York Bot. Gard.* 9 (3): 254 (1957).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *G. polys*, many; *stachys*, ear of corn. Plants with many branched culms or inflorescences.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes absent or short. Culms erect or geniculately ascending, 50–120 cm long, 1–5 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous or pubescent. Lateral branches lacking or sparse. Leaves without demarcation between sheath and blade. Leaf-sheaths 15–30 cm long, longer than adjacent culm internode, glabrous on surface. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades ascending, linear or lanceolate, 10–30 cm long, 10–30 mm wide. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary, with 1–4 peduncles per sheath. Peduncle 25–50 cm long. Racemes 2–20, digitate, ascending or spreading, unilateral, 5–20 cm long. Central inflorescence axis 3–5 cm long. Rhachis angular, 0.3–0.5 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4.8–7 spikelets per cm. Raceme-bases brief. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, acute, 2.2–2.3 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2–4 -veined. Upper glume primary vein absent. Upper glume surface glabrous or puberulous, hairy on veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 2–4 -veined, without midvein, glabrous or puberulous, hairy on veins. Fertile lemma 2 mm long, indurate, pallid or mid-green, without keel. Lemma margins involute. Lemma apex obtuse or acute, pubescent (few hairs). Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum pressum* Nees ex Steud., *Syn. Pl. Gram.* 23 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F.F. Sellow 5638*, no date, Brazil (B; IT: BAA-2258 (fragm. ex B), P, US-2942557 (fragm.)).

Recent Synonyms: *Axonopus derbyanus* (Steud.) L. Parodi, *Not. Mus. La Plata, Bot.*, 3: 23 (1938).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (52, Fig. 12).

Derivation (Clifford & Bostock 2007): L. compressed. Culms and leaf-sheaths compressed.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Rhizomes elongated, not obviously scaly or scaly. Culms robust, 80–120 cm long, 2–4 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Lateral branches lacking. Leaf-sheaths 10–40 cm long, outer margin hairy. Ligule a ciliolate membrane, 0.4–0.8 mm long. Leaf-blades erect or spreading, conduplicate, 10–30 cm long, 5–12 mm wide, stiff. Leaf-blade surface scabrous, glabrous or hirsute. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 20–50 cm long, smooth or scaberulous above. Racemes 4–30, digitate, ascending or spreading, unilateral, 10–30 cm long. Central inflorescence axis 5–7 cm long. Rhachis angular, 0.5–0.8 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5–7 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.2–0.5 mm long, glabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse or subacute, 2.2–2.7 mm long, 0.8–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma 2.2–2.7 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. **Western South America, Brazil, Southern South America.** Bolivia. Brazil West Central, Brazil Northeast, Brazil Southeast, Brazil South. Paraguay.

Mato Grosso, Goias, Bahia, Maranhao, Piaui, Minas Gerais, Rio de Janeiro, Espirito Santo, Sao Paulo Parana. Distrito Federal, Mato Grosso, Goiás. Bahia. Minas Gerais, Sao Paulo. Paraná.

Axonopus pruinus Henrard. *Blumea* 5: 527 (1945).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *E. Ule 8022*, Feb 1910, Brazil: Amazonas: auf Bergen bei Quarei am oberen Muim (Miang) Surumu, Rio Branco (L-915.106–372; IT: IAN, K, MG, US-1574203, US-2941908 (fragm. ex K & photo)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. bluish-green. Leaf-blades are covered with short white hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Butt sheaths villous, with yellow hairs. Basal innovations flabellate. Culms robust, 100–120 cm long, 1–2 -noded. Culm-nodes pubescent. Leaf-sheaths 20–30 cm long, keeled, hirsute. Ligule a ciliolate membrane, 0.5–0.6 mm long. Leaf-blades conduplicate, 30–50 cm long, 6–10 mm wide, stiff, glaucous. Leaf-blade surface pubescent. Leaf-blade apex obtuse, soon splitting or asymmetrical.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–85 cm long. Racemes 10–35, borne along a central axis, ascending, unilateral, 4–15 cm long. Central inflorescence axis 10–20 cm long. Rhachis angular, 0.2–0.4 mm wide, drab, glabrous on surface, scabrous

on margins, glabrous on margins. Spikelet packing adaxial, 5.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–0.4 mm long, scabrous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, compressed slightly or moderately, subacute, 2.3–2.4 mm long, 0.9–1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins prominent. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, prominently veined, pubescent, hairy between veins. Fertile lemma 2.3–2.4 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. French Guiana, Venezuela. Brazil North.

Roraima. Amazonas, Pará, Roraima.

Axonopus pubivaginatus Henrard. *Blumea* 5: 276 (1942).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Surinam. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *H.E. Rombouts 395H*, 20 Jan 1936, Surinam: boven Sipaliwini Kamp B (L; IT: IAN, K, MO-1575531, U, US-1914582).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. pubes*, signs of puberty; vagina, sheath; *-atum*, possessing. Leaf-sheath hairy.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 75–100 cm long, 1–4 -noded. Culm-nodes pubescent. Leaf-sheaths 7–45 cm long, keeled, pubescent. Ligule a ciliolate membrane, 0.3–0.5 mm long. Leaf-blades flat or conduplicate, 10–50 cm long, 10–20 mm wide. Leaf-blade surface smooth or scaberulous, glabrous or pubescent. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–90 cm long. Racemes 5–20, digitate, ascending, unilateral, 5–20 cm long. Central inflorescence axis 2–10 cm long. Rhachis angular, 0.3–0.7 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5–6.5 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present, reduced to a stump, 0–0.7 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, subacute, 2.2–3.1 mm long, 0.7–1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1–1.2 length of fertile lemma, 1 length of spikelet, 5 -veined, pubescent, hairy between veins. Fertile lemma 2–2.5 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. French Guiana, Guyana, Surinam, Venezuela. Colombia. Brazil West Central, Brazil Northeast, Brazil North.

Mato Grosso. Mato Grosso. Ceará, Maranhão, Pernambuco. Amapá, Amazonas, Pará.

Axonopus purpusii (Mez) Chase. *Journ. Wash. Acad. Sc.* 17: 144 (1927).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Mexico. **Basionym or Replaced Name:** *Paspalum purpusii* Mez, *Engl. Jahrb.* 56. *Beibl.* 125, 10 (1921). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database; HT: C.A. Purpus 2450, May 1907, Mexico: Veracruz: Zacuapan and vicinity (B; IT: MO-2875301, US-591124, US-2855767 (fragm. ex B)).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (81, Fig. 22), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (54, Fig. 13).

Derivation (Clifford & Bostock 2007): in honor of Carl Albert Purpus (1853–1941) German-born United States botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms 50–80 cm long, 0.5–1 mm diam. Culm-nodes flush with internodes, purple, glabrous or pubescent. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths mostly shorter than adjacent culm internode, keeled, glabrous on surface or pilose, outer margin hairy. Ligule a ciliolate membrane, 0.3–0.5 mm long. Collar pilose. Leaf-blades 15–25 cm long, 2–4 mm wide. Leaf-blade surface pilose, with tubercle-based hairs. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes. Peduncle 12–17 cm long. Racemes 3–6, digitate, unilateral, 4–8 cm long. Central inflorescence axis 1–3 cm long. Rhachis angular, 0.4–0.5 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present, reduced to a stump, pubescent.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, 1.8–2.2 mm long, with hairs extending 0.1–0.3 mm beyond apex, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 2 -veined. Upper glume primary vein absent. Upper glume margins pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 2 -veined, without midvein, pubescent on margins. Fertile lemma ovate, 1.7–2.1 mm long, indurate, without keel. Lemma margins involute. Lemma apex scabrous. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.2 mm long, purple. Caryopsis with adherent pericarp.

Illustrations (Books): E.Judziewicz, *Flora of the Guianas*, 187. *Poaceae* (1990) (104, Fig. 14).

Derivation (Clifford & Bostock 2007): *L. ramus*, branch; *-osa*, abundance. Inflorescences or culms much branched.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect or geniculately ascending, slender, 15–80 cm long. Culm-internodes elliptical in section. Culm-nodes glabrous or pubescent. Lateral branches ample. Leaf-sheaths 2–4 cm long, longer than adjacent culm internode, narrower than blade at the collar, outer margin hairy. Ligule a ciliolate membrane, 0.2 mm long. Leaf-blades 3–5 cm long, 0.5–1 mm wide. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 20–40 cm long. Racemes 2–3, paired or digitate, spreading, unilateral, 3–7 cm long. Central inflorescence axis 0.5–1.5 cm long. Rhachis angular, 0.3 mm wide, glabrous on surface, smooth on margins, glabrous on margins.

Spikelet packing adaxial, 7.5 spikelets per cm. Raceme-bases brief, glabrous. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse, 1.3–1.4 mm long, 0.5 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, dark brown, 2–4 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy on veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, dark brown, 2–4 -veined, without midvein, pubescent, hairy on veins. Fertile lemma 1.3–1.4 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. French Guiana, Surinam, Venezuela.

Axonopus rosei (Scribn. & Merr.) Chase. *Proc. Biol. Soc. Washington* 24: 132 (1911).

Derivation (Clifford & Bostock 2007): in honor of Bernardo Rosengurtt (1916-) who collected in South America.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms decumbent, 20–40 cm long, 1–3 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous. Lateral branches lacking or sparse. Leaf-sheaths 2–15 cm long, wider than blade at the collar, glabrous on surface. Leaf-sheath oral hairs ciliate. Leaf-sheath auricles absent or erect. Ligule a ciliate membrane, 0.8 mm long. Leaf-blades 8–12 cm long, 5–10 mm wide. Leaf-blade apex acute, hooded or simple.

Inflorescence. Inflorescence composed of racemes, with 2–4 peduncles per sheath. Peduncle 4–10 cm long. Racemes 2, paired, erect, unilateral, 4–9 cm long. Central inflorescence axis 0 cm long. Rhachis angular, 0.8 mm wide, drab, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 4.5–4.8 spikelets per cm. Raceme-bases brief. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present, reduced to a stump, 0–0.2 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, compressed slightly, acuminate, 2.7–3.2 mm long, 1–1.2 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 4–5 -veined. Upper glume primary vein absent or obscure. Upper glume surface glabrous or puberulous, hairy at base.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 4–5 -veined, without midvein or with obscure midvein, obscurely veined, glabrous or puberulous, hairy at base. Fertile lemma elliptic or ovate, 2.5–2.7 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Argentina Northeast, Uruguay.

Buenos Aires, Distrito Federal.

Axonopus rupestris G. Davidse. *Ann. Missouri Bot. Gard.* 74(2): 416 (1987).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. rupestris*, rock; *-estre*, place of growth; Growing amongst rocks.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Basal innovations flabellate. Culms geniculately ascending, 10–35 cm long, 1–2 mm diam., 1–2 -noded. Culm-internodes thin-walled, distally glabrous. Leaves without demarcation between sheath and blade. Leaf-sheaths 7.5 cm long, with winged keel, glabrous on surface. Ligule a ciliate membrane, 0.5–0.6 mm long. Leaf-blades erect, conduplicate, 5–

10 cm long, 2–4 mm wide. Leaf-blade surface glabrous or hirsute, sparsely hairy, hairy abaxially, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Racemes 2(–3), paired, spreading, unilateral, 4.5–6.5 cm long. Central inflorescence axis 0(–1) cm long. Rhachis angular, 0.6 mm wide, glabrous on margins. Spikelet packing adaxial, 6 spikelets per cm, regular, 2 -rowed. Raceme-bases pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, obtuse, 2.9–3.5 mm long, 0.8–1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, exceeding apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 5 -veined. Upper glume surface pilose, hairy between veins. Upper glume hairs 0.5–1 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 2.7–3.2 mm long, 0.9 length of spikelet, 4 -veined, without midvein, pilose, hairy between veins. Fertile lemma elliptic, 2.4–3.5 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Flower and Fruit. Lodicules 2, fleshy. Anthers 3, 1–1.2 mm long, yellow.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil North. Goiás. Tocantins.

Axonopus scoparius (Fluegge) Kuhl. *Comm. Linh. Telegr. Matto Grosso Amaz. Anexo 5*, Bot. 11: 45 (1922).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. **Basionym or Replaced Name:** *Paspalum scoparium* Fluegge, *Gram. Monog.* 124. (1810). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: IT: *s.c. a:139 & b:8139*, (LE-TRIN-0528.01 (fragm. ex hrb. Willd., 1836)).

HT: *Humboldt & Bonpland s.n.*, Venezuela (P; IT: US-80014 (fragm. ex B-W, P)).

Illustrations (Books): M.E.Barkworth et al, *Flora of North America north of Mexico* Vol 25 *Poaceae*, part 2 (2003) (567), S.A.Rennoize, *Gramineas de Bolivia* (1998) (502, Fig. 111), L.B. Smith, D.C. Wasshausen, R.M. Derivation (Clifford & Bostock 2007): *L. scopae*, broom; *-aria*, pertaining to. Inflorescences condensed resembling a broom.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rootstock evident. Stolons absent or present. Culms erect, robust, 100–150 cm long, 3–7 mm diam. Culm-internodes solid. Lateral branches lacking or sparse. Leaf-sheaths keeled. Ligule a ciliolate membrane, 1–2.7 mm long. Collar pubescent. Leaf-blades 15–50 cm long, 5–30 mm wide. Leaf-blade surface hirsute, with tubercle-based hairs. Leaf-blade apex acute.

Inflorescence. Inflorescence composed of racemes. Peduncle 15–30 cm long. Racemes numerous, borne along a central axis, unilateral, 6–12 cm long. Central inflorescence axis 7–15 cm long. Rhachis angular, with scattered hairs or glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 2.7–2.9 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, purple, without keels, 3 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 3 -veined, with evident midvein, pubescent, hairy between veins. Fertile lemma oblong, 2.2–2.4 mm long, indurate, without keel. Lemma surface striate. Lemma margins involute. Lemma apex obtuse, scabrous. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.5–1.7 mm long, purple. Caryopsis with adherent pericarp.

Axonopus senescens (Doell) Henrard. *Blumea* 5: 529 (1945).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from French Guiana. **Basionym or Replaced Name:** *Paspalum senescens* Doell, *Mart. Fl. Bras.* 2 (2) 119. (1877). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *F.R. LePrieur* 264, 1838, French Guiana (P; IT: K, MO-1639988, US-80016 (fragm. ex BR, P)).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. senesco*, grow old. Leaf-blades with indumentum of white hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms 50–100 cm long, 1–2 -noded. Culm-internodes elliptical in section, distally glabrous. Leaves without demarcation between sheath and blade. Leaf-sheaths 5–20 cm long, keeled, outer margin hairy. Ligule a ciliolate membrane. Leaf-blades 15–30 cm long, 3–5 mm wide. Leaf-blade surface pubescent, hairy adaxially. Leaf-blade apex abruptly acute, hooded.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle glabrous. Racemes digitate, ascending, unilateral, 5–13 cm long. Central inflorescence axis 0.5–2 cm long. Rhachis angular, 0.5–0.7 mm wide, villous on surface, scabrous on margins, setose on margins. Rhachis hairs white, 2–3 mm long. Spikelet packing adaxial, 7–10 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.1–0.2 mm long, bearing a few hairs, hairy at tip.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse to acute, 1.6–1.7 mm long, 0.6 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent. Upper glume lateral veins prominent. Upper glume surface pilose, hairy on veins, without hair tufts or with an apical beard.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein, prominently veined, pilose, hairy on veins, without hair tufts or with conspicuous apical hairs. Fertile lemma 1.6–1.7 mm long, indurate, yellow, dull, without keel. Lemma surface with conspicuous apical hairs. Lemma margins involute. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Derivation (Clifford & Bostock 2007): L. dry. Growing on dry grassy plains.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 50–90 cm long, 1–4 -noded. Culm-internodes terete. Leaf-sheaths without keel. Ligule a ciliate membrane, 0.2–0.3 mm long. Leaf-blades erect, curved, conduplicate or involute, 5–40 cm long, 2–7 mm wide, stiff. Leaf-blade surface glabrous.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 25–50 cm long. Racemes 4–30, borne along a central axis, ascending or spreading, unilateral, 5–15 cm long. Central inflorescence axis 3–15 cm long. Rhachis angular, 0.3–0.4 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6–10 spikelets per cm. Raceme-bases brief, glabrous or pubescent. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.2–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse or subacute, 1.6–2.1 mm long, 0.6–0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5 -veined, ribbed, glabrous or puberulous, hairy between veins. Fertile lemma 1.6–2.1 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Axonopus singularis Swallen) A. Lopez & O. Morrone. *Syst. Bot.* 37 (3): 675 (2012).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Centrochloa singularis* Swallen, *Journ. Wash. Acad. Sc.* 25: 192 (1935). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.R. Swallen 3703*, 1–5 Mar 1934, Brazil: Maranhão, between Barra do Corda and Grajahu. (US-1611707).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. singulus*, solitary; *-are*, pertaining to. Inflorescence consisting of a single raceme.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Annual. Culms erect, 10–75 cm long. Ligule a ciliolate membrane, 0.5 mm long. Leaf-blades conduplicate, 5–15 cm long, 3–8 mm wide.

Inflorescence. Inflorescence composed of racemes. Racemes 2–7, digitate, unilateral, 3–14 cm long. Rhachis narrowly winged, angular, 0.5 mm wide, scabrous on margins. Spikelet packing adaxial, regular, 1-rowed. Spikelets solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets obovate (turbinate), turbinate, dorsally compressed, 3.5–4 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, exceeding apex of florets, thinner than fertile lemma. Upper glume ovate, spurred, 3.5–4 mm long, membranous, without keels, 3 -veined. Upper glume surface pubescent, hairy between veins, with a transverse fringe of hair (0.7–1mm). Upper glume hairs red. Upper glume apex obtuse.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret elliptic, 1 length of spikelet, membranous, 3 -veined, pubescent, with a transverse fringe of hair, bearing red hairs, bearing hairs 0.5 mm long, obtuse. Fertile lemma obovate, 2.2–2.5 mm long, indurate. Lemma margins involute. Lemma apex obtuse, pubescent. Palea indurate.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil West Central, Brazil Northeast. Goiás, Maranhão, Piauí. Goiás. Paraíba.

Axonopus steyermarkii Swallen. *Fieldiana, Botany* 28(1): 20. 1951.

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.A. Steyermark 58001*, 26 Aug 1944, Venezuela: Amazonas: Cerro Duida, Southeastern-facing slopes of sandstone bluffs near Caño Negro (tributary of Caño Iguapo), moist bluffs, alt. 1095–1520 m (US-1911649).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (62, Fig. 37).

Derivation (Clifford & Bostock 2007): in honor of Julian Alfred Steyermark (1909–1988) United States botanist who worked principally in Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms 40–60 cm long, 1 -noded. Culm-nodes glabrous. Leaves mostly basal. Leaf-sheaths 6–10 cm long, wider than blade at the collar, keeled. Leaf-sheath auricles erect. Ligule a ciliolate membrane, 0.4–0.5 mm long. Leaf-blades 15–25 cm long, 5–7 mm wide. Leaf-blade apex obtuse, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 2–3 peduncles per sheath. Peduncle 20–30 cm long. Racemes 3–4, digitate, ascending, unilateral, 6–9 cm long. Central inflorescence axis 2–4 cm long. Rhachis angular, 0.3 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 3.5–4.5 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 1 mm long, puberulous.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acute, 2.8–3 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, dark brown, 5 -veined. Upper glume surface glabrous or puberulous, hairy between veins, without hair tufts or with an apical beard.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, dark brown, 5 -veined, with unevenly spaced veins (near margin), glabrous or puberulous, hairy between veins, without hair tufts or with conspicuous apical hairs. Fertile lemma elliptic, 2.5 mm long, indurate, light brown, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus succulentus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 134 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Paraguay. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *T. Rojas 6176*, Feb 1933, Paraguay: Cordillera: campo serrania, Ybytymi Cordillerita, 25:46'S, 56:48'W, perenne 60–80 cm (US-2012951; IT: BAA).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (61, Fig. 15).

Derivation (Clifford & Bostock 2007): *L. succus*, juice; *-ulentus*, well developed. Foliage a useful fodder.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms 60–120 cm long, 3–4 -noded. Culm-nodes glabrous. Leaf-sheaths 8–30 cm long. Leaf-sheath auricles absent or erect. Ligule a ciliolate membrane. Leaf-blades 10–50 cm long, 10–20 mm wide, light green or glaucous. Leaf-blade surface smooth, glabrous. Leaf-blade apex obtuse, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 2–3 peduncles per sheath. Peduncle 30–45 cm long. Racemes 15–25, digitate, ascending, unilateral, 8–18 cm long. Central inflorescence axis 5–8 cm long. Rhachis angular, 0.4 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5–5.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile. Pedicels present, reduced to a stump, bearing a few hairs, hairy at base.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong or ovate, dorsally compressed, obtuse or subacute, 2.4–2.5 mm long, 0.7–0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, purple, 2 -veined. Upper glume primary vein absent. Upper glume surface pubescent, hairy on veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein, pubescent, hairy on veins. Fertile lemma 2.4–2.5 mm long, indurate, light brown or dark brown, shiny, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Southern South America. Paraguay.

Axonopus suffultiformis G. A. Black. *Mem. N. Y. Bot. Gard.* 9: 253 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online.

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *B. Maguire, Cowan & Wurdack 30520*, 1 Jan 1951, Venezuela: Amazonas: Cerro Yapacana, Rmo Orinoco, locally frequent, conduplicate, NW slopes, (US-2040241).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (62, Fig. 36 as var. *suffultiformis*).

Derivation (Clifford & Bostock 2007): L. forma, appearance. Similar in appearance to *Axonopus suffultus*.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Basal innovations flabellate. Culms erect, 100 cm long, 1–2-noded. Culm-nodes glabrous. Leaf-sheaths 8–9 cm long, keeled. Ligule an eciliate membrane, 0.2 mm long. Leaf-blades persistent or deciduous at the ligule, conduplicate, 20–40 cm long, 10–12 mm wide, stiff, light green. Leaf-blade surface glabrous. Leaf-blade apex obtuse, soon splitting or simple.

Inflorescence. Inflorescence composed of racemes, with 2 peduncles per sheath. Peduncle 25–30 cm long. Racemes 9, digitate, ascending, unilateral, 5–12 cm long. Central inflorescence axis 1–3.5 cm long. Rhachis angular, 0.3 mm wide, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 10 spikelets per cm. Raceme-bases brief, pubescent or pilose. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels present, reduced to a stump, 0–0.4 mm long, ciliate, hairy at base, with 0.5–0.8 mm long hairs.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 2 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, light green, 5-veined. Upper glume surface glabrous or puberulous, hairy at base.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, light green, 5-veined, glabrous or puberulous, hairy at base. Fertile lemma 2 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament or pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus suffultus (Mikan ex Trin.) L. Parodi. *Not. Mus. La Plata, Bot.*, 3: 23 (1938).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum suffultum* Mikan ex Trin., *Spreng. Neue Entdeck.* 2: 46 (1821). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.S. Mikan*, In Brasilia (LE-TRIN-0537.07 (& illustr.); IT: US-80029 (fragm. ex LE)).

Illustrations (Books): F.O.Zuloaga, Z.E.Rugolo & A.M. Anton, *Flora Argentina* 3 – 1, Aristidoideae a Pharoideae (2012) (270), L.B. Smith, D.C. Wasshausen, R.M. Klein *Flora Illustrada Catarinensis Gramineas* (1981–1982) (1105, Fig. 218 & 1135, Fig. 221), A.Burkat, *Flora Illustrada de Entre Rios (Argentina)*, Pt II, Gramineas (1969) (415, Fig. 174), A.L.Cabrera, *Flora de la Provincia de Buenos Aires, IV Pt 2 Gramineas* (1970) (502, Fig. 130), F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (63, Fig. 16), B.Rosengurt, *Gramineas Uruguayas I* (1970) (282, Fig. 121).

Derivation (Clifford & Bostock 2007): L. *suffulcio*, support from beneath. Rhizome raised off the soil by prop roots.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms 40–120 cm long. Culm-nodes glabrous. Ligule a ciliate membrane. Leaf-blades 10–60 cm long, 2–6 mm wide. Leaf-blade apex abruptly acute.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Racemes 10–25, digitate, ascending, unilateral, 3–10 cm long. Rhachis angular, 0.6 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 5.5 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.2–0.3 mm long, ciliate, hairy at base, with 1–1.5 mm long hairs.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, obtuse, 2.3 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, hyaline, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, hyaline, 2 -veined, without midvein. Fertile lemma 2.3 mm long, indurate, dark brown, shiny, without keel. Lemma margins involute. Lemma apex obtuse, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

n = 10 (1 ref TROPICOS).

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast, Brazil South. Argentina Northeast, Paraguay, Uruguay.

Axonopus sulcatus G. A. Black. *Advanc. Front. Pl. Sci.* 5: 94 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *J.G. Kuhlmann 2073*, 24 Apr 1924, Brazil: Para: Macapa: planta de campo a sombra de diversas arvores (US-1447872).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. sulcus*, furrow; *-ata*, possessing. Fertile lemmas grooved.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, 80–100 cm long, 2–3 -noded. Culm-nodes bearded. Leaves basal and cauline. Leaf-sheaths 8–12 cm long, narrower than blade at the collar, keeled. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blade base cuneate or truncate. Leaf-blades 8–22 cm long, 7–10 mm wide. Leaf-blade surface glabrous. Leaf-blade apex acuminate.

Inflorescence. Inflorescence composed of racemes, with 2 peduncles per sheath. Peduncle 25 cm long. Racemes 10, digitate, ascending, flexuous, unilateral, 8–15 cm long. Central inflorescence axis 3 cm long. Rhachis angular, 0.5–0.6 mm wide, glabrous on surface, smooth on margins or scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 5 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, 0.3–0.4 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 2 mm long, 0.7 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins ribbed. Upper glume surface pubescent, hairy between veins. Upper glume hairs purple.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 5 -veined, ribbed, pubescent, hairy between veins, bearing purple hairs. Fertile lemma linear, 1.7–1.8 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil North.

Para, Amapa. Amapa.

Axonopus surinamensis (Steud.) Henrard. *Blumea* 5: 275 (1942).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Surinam. **Basionym or Replaced Name:** *Panicum surinamense* Hochst. ex Steud., *Syn. Pl. Gram.* 42 (1854). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Surinam, *Hostmann & Kappler 1283* (IT: IAN, K, US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): *L. -ensis*, denoting origin. From Surinam.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose, clumped densely. Basal innovations subterete or flabellate. Culms robust, 100–200 cm long, 3–5 mm diam., 1–3 -noded. Culm-internodes elliptical in section. Culm-nodes glabrous or pubescent. Lateral branches lacking. Leaves basal and cauline. Leaf-sheaths 15–50 cm long, keeled, hirsute. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades 10–40 cm long, 2–15 mm wide. Leaf-blade surface glabrous or pilose. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, terminal or terminal and axillary, with 1–3 peduncles per sheath. Peduncle 35–100 cm long. Racemes 8–10, digitate, ascending or drooping, unilateral, 12–20 cm long. Central inflorescence axis 2–10 cm long. Rhachis angular, 0.4–0.5 mm wide, drab, glabrous on surface, scaberulous on margins, glabrous on margins. Spikelet packing adaxial, 5–6.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, subacute, 3–3.2 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins prominent. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.3–1.4 length of fertile lemma, 1 length of spikelet, 5 -veined, glabrous or puberulous, hairy between veins. Fertile lemma 2.1–2.7 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Brazil. French Guiana, Guyana, Surinam, Venezuela. Brazil West Central, Brazil Northeast, Brazil North.

Axonopus swallenii G. A. Black. *Advanc. Front. Pl. Sci.* 5: 92 (1963).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Para: Large erect or spreading clumps, open sandy land, Santarem, 19–26 Jan 1934, *J. R. Swallen 3258* (HT: US).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): in honor of Jason Richard Swallen (1903–1991) United States botanist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Culms erect, robust, 120 cm long, 5–10 -noded. Culm-nodes pubescent. Leaves without demarcation between sheath and blade. Leaf-sheaths 20–30 cm long, keeled, hirsute. Ligule a ciliolate membrane, 0.7–0.8 mm long. Leaf-blades flat or conduplicate, 30 cm long, 5–12 mm wide. Leaf-blade surface hirsute, densely hairy. Leaf-blade apex attenuate.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 40 cm long. Racemes 14, borne along a central axis, ascending, unilateral, 8–12 cm long. Central inflorescence axis 7 cm long. Rhachis angular, 0.5–0.6 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 6.5–7.5 spikelets per cm. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled. Pedicels absent or present, 0–0.2 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, acute, 2.5 mm long, 0.7–0.8 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5 -veined. Upper glume surface pubescent, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.1 length of fertile lemma, 1 length of spikelet, 5 -veined, pubescent, hairy between veins. Fertile lemma linear, 2.2 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acute, without ornament. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Axonopus tenuis S.A. Renvoize. *Kew Bull.* 39(1): 182 (1984).

Accepted by: U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Brazil: Bahia: Lagoa Encantada, 19 km NW of Ibicoara, 1 Feb 1974, R.M. Harley et al. 15788 (HT: CEPEC; IT: US).

Illustrations (Books): S.A.Renvoize, *The Grasses of Bahia*, 1984 (191, Fig. 72).

Derivation (Clifford & Bostock 2007): L. thin. Culms, leaf-blades or pedicels, slender.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms slender, 30–50 cm long. Ligule a ciliolate membrane. Leaf-blades filiform, 4–10 cm long, 1 mm wide. Leaf-blade apex acute or acuminate.

Inflorescence. Inflorescence composed of racemes. Racemes 2–4, paired or digitate, ascending, unilateral, 2.5–5 cm long. Central inflorescence axis 0 cm long. Rhachis angular, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, ciliate.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or oblong, dorsally compressed, obtuse, 1.2 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 2 -veined. Upper glume primary vein absent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 2 -veined, without midvein. Fertile lemma 1.2 mm long, indurate, pallid, without keel. Lemma margins involute. Lemma apex obtuse. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil. Brazil Northeast.

Axonopus triglochinos (Mez) Dedecca. *Bragantia* 15 : 280 (1956).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Colombia. **Basionym or Replaced Name:** *Paspalum triglochinos* Mez, *Repert. Spec. Nov. Regni Veg.* 15: 61 (1917). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: Colombia: Guainia: ad flum. Guainia, Rio Negro supra ostium fluminis Casiquiare, insula arenosa inundata fl. Guainia, R. Spruce 3756, 1854 (B; IT: BR, G-Bois., K, US-80055 (fragm.), W).

Illustrations (Books): J.A.Steyermark et al, *Flora of the Venezuelan Guayana* Vol. 8 (2004) (58, Fig. 28).

Derivation (Clifford & Bostock 2007): Gk. *-oides*, resembling. Similar to *Triglochin*.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Stolons present. Culms 25–65 cm long, 1–2 -noded. Culm-internodes terete. Culm-nodes glabrous or pubescent. Leaves mostly basal, without demarcation between sheath and blade. Leaf-sheaths 8–20 cm long, without keel. Leaf-sheath oral hairs pubescent. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades 10–30 cm long, 1–2 mm wide. Leaf-blade apex filiform.

Inflorescence. Inflorescence composed of racemes, with 1 peduncles per sheath. Peduncle 10–17 cm long. Racemes 2–3, paired or digitate, ascending, unilateral, 5–10 cm long. Central inflorescence axis 0 cm long. Rhachis angular, 0.3–0.4 mm wide, drab, glabrous on surface, smooth on margins, glabrous on margins. Spikelet packing adaxial, 2.5 spikelets per cm. Raceme-bases linear, 10–15 mm long, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, acuminate, 3.6–4 mm long, 1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 3–5 -veined. Upper glume surface puberulous, hairy between veins, without hair tufts or with an apical beard.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2 length of fertile lemma, 1 length of spikelet, 3–5 -veined, puberulous, hairy between veins, without hair tufts or with conspicuous apical hairs. Fertile lemma 3 mm long, indurate, pallid or yellow, without keel. Lemma margins involute. Lemma apex acuminate, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America, Western South America, Brazil. Venezuela. Colombia. Brazil West Central.

Amazonas, Acre, Rondonia. Amazonas.

Axonopus uninodis (Hackel) G. A. Black. *Advanc. Front. Pl. Sci.* 5: 102 (1963).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Brazil. **Basionym or Replaced Name:** *Paspalum uninode* Hack., *Denkschr. Akad. Wien, Math.-Nat.* 79: 67 (1908). T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: *M. Wacket s.n.*, 1902, Brazil: Sco Paulo: Pilar, between Alto da Serra and Santos (W; IT: US-2856020).

Illustrations (Books): F.O.Zuloaga et al, *Flora del Paraguay* 23 (1994) (65, Fig. 17).

Derivation (Clifford & Bostock 2007): L. *unus*, one; *nodus*, knot. Flowering culms with a single node.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Rhizomes short. Butt sheaths persistent and investing base of culm, with compacted dead sheaths. Culms erect, 50–80 cm long, 1–3 -noded. Culm-internodes elliptical in section, 20–35 cm long, yellow or purple, smooth, distally glabrous. Culm-nodes pubescent or bearded. Lateral branches lacking. Leaves mostly basal. Leaf-sheaths 6–14 cm long, glabrous on surface, outer margin glabrous or hairy. Leaf-sheath oral hairs ciliate. Ligule a ciliolate membrane, 0.3 mm long. Collar glabrous. Leaf-blades filiform, involute, 17–60 cm long, 0.5–1 mm wide, stiff. Leaf-blade surface glabrous, hairless except near base. Leaf-blade apex acuminate, pungent, hardened, hairy.

Inflorescence. Inflorescence composed of racemes. Peduncle 20–50 cm long, glabrous. Racemes 2–4(–7), digitate or borne along a central axis, erect or ascending, flexuous, unilateral, 4–8.5 cm long. Central inflorescence axis 2–6 cm long. Rhachis angular, 0.3–0.6 mm wide, drab, glabrous on surface, glabrous on margins. Spikelet packing adaxial, 2 -rowed. Raceme-bases glabrous. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, oblong, 0.2–0.6 mm long.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the

lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, acuminate, 4.2–4.5 mm long, 0.9 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 4–4.6 mm long, 1 length of spikelet, membranous, 5 -veined. Upper glume lateral veins obscure. Upper glume margins villous. Upper glume hairs 1–2.4 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 4.2–4.8 mm long, 1.3–1.4 length of fertile lemma, 1 length of spikelet, 5 -veined, obscurely veined, villous on margins, bearing hairs 1–2.4 mm long. Fertile lemma elliptic, 3–3.8 mm long, 0.8 mm wide, indurate, yellow, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Lodicules 2, cuneate, 0.2 mm long. Anthers 3, 2.7 mm long, purple. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Brazil, Southern South America. Brazil Southeast. Paraguay. Sao Paulo.

Axonopus villosus Swallen. *Fieldiana, Bot.*, 28 No. 1, 21 (1951).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *fide* TROPICOS and Kew Synonymy Database: HT: J.A. Steyermark 58226, 2 Sep 1944, Venezuela: Amazonas: summit of Cerro Duida, Savanna Hills, alt. 1025–1200 m (F; IT: US-1911651).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *villi*, long weak hairs; *-osa*, abundance. The plant in whole or in part covered with long hairs.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial. Basal innovations flabellate. Culms robust, 70–200 cm long. Culm-nodes bearded. Leaves without demarcation between sheath and blade. Leaf-sheaths hirsute. Ligule a ciliolate membrane, 0.3 mm long. Leaf-blades conduplicate, 10–17 cm long, 6–10 mm wide, stiff. Leaf-blade surface hirsute.

Inflorescence. Inflorescence composed of racemes, with 2 peduncles per sheath. Racemes 4–6, digitate, ascending or spreading, unilateral, 7–16 cm long. Central inflorescence axis 2–5 cm long. Rhachis angular, 0.4 mm wide, glabrous on surface, scabrous on margins, ciliate on margins. Rhachis hairs 1–2 mm long. Spikelet packing adaxial, 4.5 spikelets per cm. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets oblong, dorsally compressed, subacute, 3.5–4 mm long, 1–1.2 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 5–7 -veined. Upper glume surface glabrous or puberulous, hairy between veins.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1.2 length of fertile lemma, 1 length of spikelet, 5–7 -veined, glabrous or puberulous, hairy between veins. Fertile lemma 3 mm long, indurate, yellow, without keel. Lemma margins involute. Lemma apex obtuse, pubescent. Palea involute, indurate.

Flower and Fruit. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus volcanicus R.W. Pohl. *Fieldiana, Bot., n.s.*, 4: 84 (1980).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Costa Rica. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: R.W. Pohl 12662, 30 Jun 1971, Costa Rica: Guanacaste: W Volcan de la Vieja, Los Capelares, 10:50'N, 85:21'W, 1400 m (ISC; IT: CR-69368).

Illustrations (Books): W.Burger, *Flora Costaricensis* 15, Gramineae: *Fieldiana Botany New Series* 4 (1980) (85, Fig. 24).

Derivation (Clifford & Bostock 2007): L. *Vulcanus*, god of fire; *-icus*, belonging to. Collected from a volcanic peak in Costa Rica.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Culms erect, 30–80 cm long, 1–3 mm diam. Culm-internodes elliptical in section, thick-walled or solid. Lateral branches ample. Leaf-sheaths longer than adjacent culm internode, keeled, outer margin hairy. Ligule a ciliolate membrane, 0.7–0.9 mm long. Collar pilose. Leaf-blades 9–20 cm long, 4–7 mm wide. Leaf-blade midrib prominent beneath. Leaf-blade margins tuberculate-ciliate. Leaf-blade apex obtuse, hooded.

Inflorescence. Inflorescence composed of racemes. Peduncle 6–15 cm long. Racemes 3–8, digitate, unilateral, 6–13 cm long. Central inflorescence axis 1–3 cm long. Rhachis angular, 0.5 mm wide, with scattered hairs, scabrous on margins, glabrous on margins. Spikelet packing adaxial. Raceme-bases brief, pilose. Spikelets appressed, solitary. Fertile spikelets sessile.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets ovate, dorsally compressed, 3–3.5 mm long, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume ovate, 1 length of spikelet, membranous, without keels, 4–5 -veined. Upper glume primary vein absent or obscure. Upper glume surface pubescent, hairy at base. Upper glume margins pubescent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, ovate, 1 length of spikelet, 4–5 -veined, without midvein or with obscure midvein, pubescent, hairy at base, pubescent on margins. Fertile lemma elliptic, 2.5–3.1 mm long, indurate, without keel. Lemma surface striate. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, 2.2 mm long, purple. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Mesoamerica. Costa Rica.

Axonopus yutajensis G. Black. *Mem. N. Y. Bot. Gard.* 9: 251 (1957).

Accepted by: R.J.Soreng et al., *Catalogue of New World Grasses* (2000–2003) and online, W.D.Clayton & K.Harman, *GrassBase* (2008) and online, U.Quattrocchi, *CRC World Dictionary of Grasses* (2006).

TYPE from Venezuela. T:<Type of Basionym>: *vide* TROPICOS and Kew Synonymy Database: HT: B. Maguire & C.K. Maguire 35265, 15 Feb 1953, Venezuela: Amazonas: Cerro Yutaje, Serrania Yutaje, Rmo Manapiare, along fork of Caqo Yutaje, 1300–1400 m, clumped about 1 m high, common, thickets along fork of Caqo Yutaje (US-2116108).

Recent Synonyms: *Axonopus arundinaceus* G. Black, *Mem. N. Y. Bot. Gard.* 9: 251 (1957).

Illustrations: None found.

Derivation (Clifford & Bostock 2007): L. *-ensis*, denoting origin. From Cerro Yutaje, Venezuela.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Basal innovations flabellate. Culms erect, robust, 75–100 cm long, 1–2 -noded. Culm-nodes glabrous. Lateral branches sparse. Leaves mostly basal. Leaf-sheaths 6–35 cm long, keeled. Ligule a ciliolate membrane, 0.3–0.4 mm long. Leaf-blades deciduous at the ligule, conduplicate, 5–30 cm long, 4–7 mm wide, stiff, light green. Leaf-blade surface glabrous. Leaf-blade apex obtuse.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 30–45 cm long. Racemes 5–8, digitate, ascending or spreading, unilateral, 10–20 cm long. Rhachis angular, 0.5 mm wide, drab, glabrous on surface, scabrous on margins, glabrous on margins. Spikelet packing adaxial, 4 spikelets per cm. Spikelets appressed, solitary. Fertile spikelets pedicelled. Pedicels present, reduced to a stump, 0.3–0.5 mm long, ciliate, hairy at base, with 1–3 mm long hairs.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets elliptic or ovate, dorsally compressed, obtuse, 2.5–2.8 mm long, 1–1.2 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume 1 length of spikelet, membranous, 7 -veined. Upper glume lateral veins prominent.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, 1 length of fertile lemma, 1 length of spikelet, 5–7 -veined. Fertile lemma 2.5–2.8 mm long, indurate, yellow or light brown, without keel. Lemma margins involute. Lemma apex acute, pubescent. Palea involute, indurate.

Flower and Fruit. Anthers 3, 1.2–1.3 mm long, purple. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Northern South America. Venezuela.

Axonopus zuloagae Giraldo-Caças. *Caldasia* 20(2): 89, f. 3–4. 1998.

Derivation (Clifford & Bostock 2007): in honor of Fernando Zuloaga (194x-), Argentinean agrostologist.

Classification. Subfamily Panicoideae. Tribe: Paspaleae. Subtribe Paspalinae.

Habit, Vegetative Morphology. Perennial, caespitose. Cataphylls evident. Butt sheaths pubescent. Basal innovations flabellate. Culms 9–32 cm long. Culm-internodes 2–5 cm long. Culm-nodes pubescent. Leaf-sheaths 1.5–7 cm long, striately veined, glabrous on surface. Ligule a ciliate membrane, 0.1–0.3 mm long. Leaf-blades flat or conduplicate, 0.8–13 cm long, 1.5–2.4 mm wide. Leaf-blade surface scaberulous, glabrous, hairless throughout or except near base. Leaf-blade apex obtuse, hooded.

Inflorescence. Inflorescence composed of racemes, with 1–2 peduncles per sheath. Peduncle 6–22.5 cm long, glabrous. Racemes 2, paired, flexuous, unilateral, 1.8–4 cm long. Rhachis angular, scaberulous on margins. Spikelet packing adaxial. Raceme-bases brief, pubescent. Spikelets appressed, solitary. Fertile spikelets sessile or pedicelled.

Fertile Spikelets. Spikelets comprising 1 basal sterile florets, 1 fertile florets, without rhachilla extension. Spikelets of 1 fertile floret with or without additional sterile florets. Spikelets two-flowered - the lower floret male or barren, the upper fertile. Spikelets lanceolate or elliptic, dorsally compressed, acute, 2.6–3.8 mm long, 0.9–1.1 mm wide, falling entire.

Glumes. Glumes one the lower absent or obscure, reaching apex of florets, thinner than fertile lemma. Upper glume elliptic, 1 length of spikelet, membranous, without keels, 53 -veined. Upper glume lateral veins prominent. Upper glume surface glabrous or pilose. Upper glume hairs 0.1–1 mm long.

Florets. Basal sterile florets 1, barren, without significant palea. Lemma of lower sterile floret similar to upper glume, elliptic, 1.1 length of fertile lemma, 1 length of spikelet, 5 -veined, glabrous or pilose, bearing hairs 0.1–1 mm long. Fertile lemma elliptic, 2–3 mm long, indurate, yellow, shiny, without keel. Lemma surface papillose. Lemma margins involute. Lemma apex pubescent. Palea involute, indurate.

Flower and Fruit. Lodicules 2, 0.3 mm long. Anthers 3, 1–1.2 mm long, purple. Caryopsis with adherent pericarp.

Distribution (TDWG). Continent. South America.

Country /Province /State. Western South America. Colombia.
